# Technical Appendix

The simulations in the text were obtained using the following methodology. The empirical results from work by David Aschauer were used to construct the following model [14]:

$$\frac{\Delta k}{k} = a_0 + a_1 \cdot \left(\frac{\Delta k(-1)}{k(-1)}\right) + a_2 \cdot r + a_3 \frac{\Delta kg}{k} \qquad (1)$$

$$r = b_0 + b_1 \cdot time + b_2 \cdot \log\,(k/n) + b_3 \cdot \log\,(kg/n) \qquad (2)$$

$$\Delta(y/n) = c_0 + c_1 \Delta(k/n) + c_2 \cdot \Delta(kg/n) \qquad (3)$$

| | | |
|---|---|---|
| Where: | k= | net fixed private capital stock |
| | r= | rate of return to private capital |
| | kg= | net fixed public nonmilitary stock |
| | n= | civilian labor force |
| | y/n= | output per laborer |
| | $\Delta$x= | absolute annual change in variable x |
| | $a_i$= | parameters |
| | $b_i$= | parameters |
| | $c_i$= | parameters |

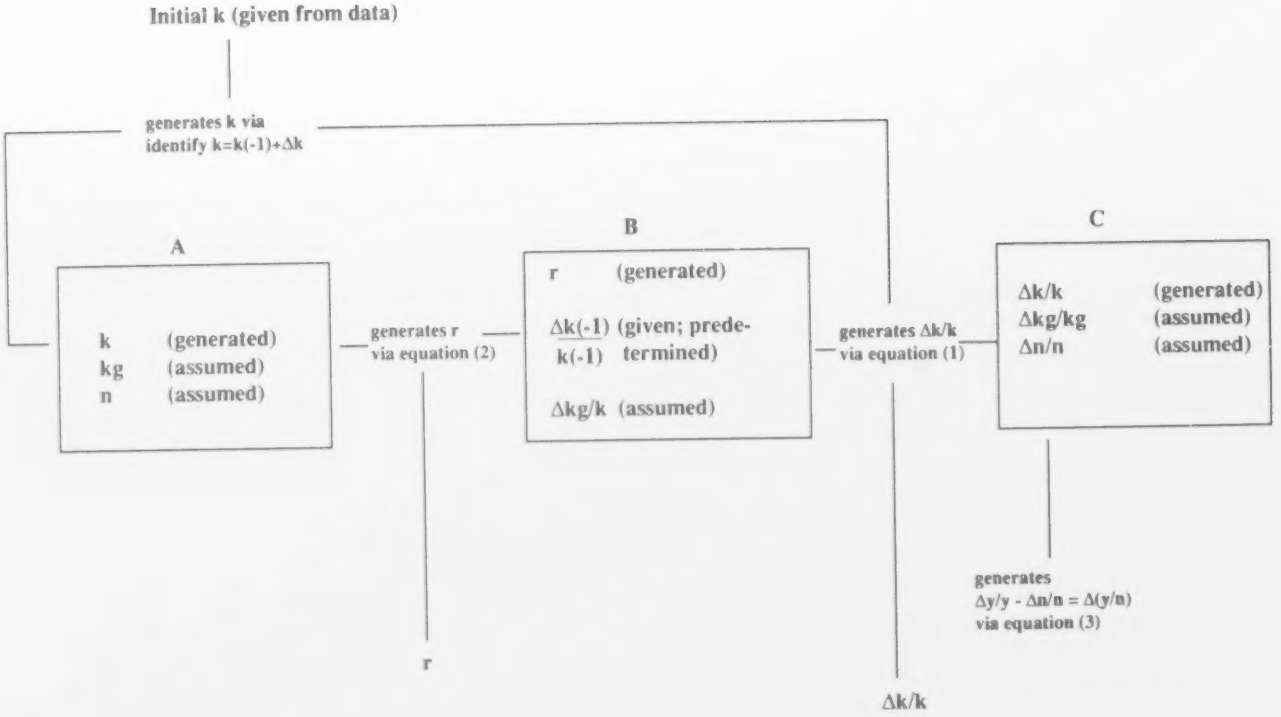
This model was then used to generate values for $\Delta$k/k, r, and $\Delta$(y/n) from 1988 to 2012. In order to do this, the end-of-year, 1987 net fixed private capital stock was used as a "start-up" value for the capital stock and various baseline assumptions were made regarding:

- future growth in and levels of the civilian labor force (taken from the Wharton Econometric Forecasting Associates (WEFA) forecast);
- future nonmilitary investment in infrastructure (the scenarios discussed in the text).

The schematic on the next page describes the dynamics of the simulation model.

To obtain 1988 values of the variables of interest, the initial capital stock is fed into box A where, along with assumed values for public

# Schematic of Simulation Process



infrastructure capital and the labor force, it determines the rate of return to capital via the equation. The output of this step is fed into box B where, along with 1987 growth in the private capital stock (predetermined) and assumed change in public capital, it determines the 1988 level of investment (actually, growth in private capital stock) via equation.

The output of this step accomplishes two functions. First, it feeds back into box A via the identity $k=k(-1) + \Delta k$ to supply the capital input necessary to help generate the 1989 rate of return to private capital, thereby perpetuating the model dynamics. Second, the growth rate of the private capital stock feeds into box C where, along with the assumed changes in the public capital stock and in the labor force, it generates productivity growth for the present period.

## Meeting America's Highway & Bridge Capital Needs

# An Analysis of the Bush Administration Proposal for Reauthorization of the Federal-aid Highway & Mass Transit Programs

American Road & Transportation Builders Association

February 1991

American Road & Transportation Builders Association

# An Analysis of the Bush Administration Proposal for Reauthorization of the Federal-aid Highway and Mass Transit Programs

## *Introduction*

On February 14, President Bush and U.S. Transportation Secretary Skinner unveiled the Bush Administration's legislative proposals for reauthorization of the federal-aid highway and mass transit programs at a White House news conference. Absent Congressional action, these programs are scheduled to expire October 1.

The Administration's proposed legislation would significantly change both programs. This document provides a detailed analysis of the Administration bill and compares it to the proposed Federal-aid Highway Program advocated by the American Road & Transportation Builders Association (ARTBA), a national federation of public and private transportation construction interests. The ARTBA proposal seeks to fully address the capital needs that were identified in the U.S. Department of Transportation's most recent report to Congress on highway and bridge conditions.

## *Overall Highway & Bridge Program Funding*

- Under the Administration proposal, the federal government would provide a total $88.4 billion to the states for highway and bridge programs over 5 years (FY92-FY96). This would mean a very modest increase in overall federal investment above the FY91 baseline level of $16.2 billion. (The current baseline includes the $14.5 billion obligation limitation, plus $1.7 billion authorized outside the ceiling, primarily for the minimum allocation and emergency relief programs and demonstration projects. The funding totals in the Administration bill include money now available outside of the obligation limitation.)

  Put another way, if Congress simply extended federal funding for highways for the next 5 years at the current level, total funding during the life of the authorization would be $80.5 billion. Thus, the Administration proposal would only authorize an additional 10 percent in total funding above the current baseline.

  Over the life of the Administration's proposal, total federal highway funding would merely keep pace with a 5 percent annual increase in inflation. (A $16.1 billion program adjusted annually for a 5 percent increase in inflation would require annual authorizations as follow: FY93, $16.90; FY94, $17.75; FY95, $18.64; and FY96, $19.57. Five-year total: $88.96 billion).

- The Administration's proposed annual authorizations are as follows:

| | | |
|---|---|---|
| FY92 | $16.1 billion | ($15.8 billion construction-related, $327 million for non-construction safety programs) |
| FY93 | $16.4 billion | ($16.1 billion construction-related, $327 million for non-construction safety programs) |

| | | |
|---|---|---|
| FY94 | $17 .0 billion | ($16.6 billion construction-related, $327 million for non-construction safety programs) |
| FY95 | $18.4 billion | ($18.1 billion construction-related, $327 million for non-construction safety programs) |
| FY96 | $20.4 billion | ($20.1 billion construction-related, $327 million for non-construction safety programs). |

**ARTBA Position:**

**The U.S. Department of Transportation's most recent report to Congress on the condition of the nation's highways and bridges suggests that a sustained investment of nearly $40 billion per year is necessary to meet capital needs on the federal-aid system. ARTBA recommends that Congress fund the Federal-aid Highway Program at the required $40 billion per year investment level.**

## *Highway Trust Fund & Revenue Issues*

- The program funding level advocated in the Administration bill would result in a $2.5 billion increase in the Highway Trust Fund's Highway Account by the end of FY96, to $13.6 billion.
- The Administration bill would extend the Highway Trust Fund through FY98.
- The Administration bill would not extend the 5 cents-per-gallon increase in the federal motor fuels excise, enacted in 1990, beyond September 30, 1995. Under the Administration proposal, beginning in FY96, federal highway user fees would revert to levels in effect on November 30, 1990—9 cents-per-gallon—as provided in the *1990 Deficit Reduction Act*.
- The Administration bill does not propose any increase in federal highway user fees to fund an expanded program.
- The Administration bill does not advocate dedicating the 2.5 cents-per-gallon in the federal motor fuels excise that is now used for non-transportation spending to the Highway Trust Fund.
- The Administration proposal does not advocate an end to the federal tax subsidy on the sale of gasohol.

**ARTBA Position:**

- **The federal highway user fees should be raised to the level necessary to finance a $40 billion per year Federal-aid Highway Program.**
- **Authorizations in the federal highway reauthorization bill should require a spend-down of the Highway Trust Fund balance to the minimum level necessary for cash-flow purposes.**
- **The Highway Trust Fund should be made permanent in recognition of the fact that there will always be a need for a substantial federal role in building and repairing a national highway and bridge network.**
- **The five cents-per-gallon increase in the federal motor fuels excise, enacted in 1990, should be made permanent, with all of the revenue dedicated to the Highway Trust Fund.**
- **The federal tax subsidy on the sale of gasohol should be eliminated.**

## *Federal vs State Responsibility: Financing A National Highway System*

- In order to qualify for federal highway funds, states are required to provide matching funds of their own. Depending on the program category, states must contribute 10 to 25 percent of a project cost. Current matching ratios result in the federal government assuming about 83 percent of the overall cost of maintaining a National Highway System. The Administration bill would lower the overall federal share to about 72 percent. Under the proposal, the states will need to raise an additional $2.6 billion per year to take advantage of federal funds.

- Here's how the Administration bill would change the federal/state matching ratios:

| Current Program | | Proposed Program | |
|---|---|---|---|
| Interstate Construction | 90% | Nat'l Highway System | 75% |
| Interstate 4R | 90% | Interstate 3-R | 90% |
| Primary | 75% | Interstate Operations | 90% |
| Urban | 75% | Urban/Rural Block Grant | 60% |
| Secondary | 75% | | |
| Bridge | 80% | Bridge | 75% |

**ARTBA Position:**

**The federal government should not retreat from its current level of financial responsibility for building and repairing the national highway and bridge network. The Administration's rationale for lowering the federal share of project costs is that doing so will provide financial leverage, thus expanding the overall program. ARTBA believes that an expanded program is more readily and efficiently achieved by raising additional highway user revenue at the federal level, rather than hoping that 50 states will individually be able to raise additional revenue. It should be recognized that in FY90 a some states were not been able to generate enough revenue to provide the matching funds necessary to put their total federal apportionment to work.**

**ARTBA believes the federal/state matching ratios should be as follows:**

- **A newly-defined National Highway System 90%**
- **Secondary System 75%**
- **Urban (Metropolitan Assistance) System 75%**
- **Bridge Program 90%**
- **Safety Construction Programs 100%**

## *Creation of a "National Highway System"*

- Currently, the Federal-aid Highway Program is composed of five major system categories: the Interstate Highway System (42,798 miles), the Primary System (258,120 miles), the Secondary System (398,329 miles), the Urban System (147,979 miles) and the bridges eligible for federal assistance. The Administration bill would consolidate and restructure these categories and put the greatest federal emphasis on upgrading and maintaining a 150,000-mile "National Highway System" of the most heavily travelled roads.

- The new National Highway System (NHS) would include the present Interstate Highway System (and any future additions to it), approximately one-third of the current mileage on the Primary System, roads that are part of the Strategic Highway Network—those that provide access to defense-related facilities—and principal urban and rural arteries. While the proposal would limit the NHS to 150,000 miles, the U.S. Department of Transportation would be given discretionary authority to include up to an additional 15,000 miles on the system.

- The creation of a NHS will require the states to reclassify many highways. In addition to Interstate System mileage, states may seek U.S. Department of Transportation approval for the inclusion of specific Primary, Secondary and Urban System mileage within the NHS. States would have until September 30, 1993 to complete the NHS designation process.

- The NHS would be funded as follows: FY92, $7.67 billion; FY93, $7.79 billion; FY94, $8.05 billion; FY95, $8.85 billion; and FY96, $11.15 billion.

**ARTBA Position:**

- **ARTBA supports the concept of the newly-defined National Highway System.**

- **Approximately 40 percent of the pavement mileage on the Interstate Highway System alone is currently in imminent need of improvements, according to the U.S. Department of Transportation's most recent report to Congress on the condition of the nation's highways and bridges.**

  **To meet these needs, annual authorizations of $17.5 billion are necessary to adequately meet capital needs on the newly-defined system and to fund a new program to upgrade highways that provide access to emerging economic centers not currently served by the Interstate System to near-Interstate standard.**

- **The federal financing share for construction and repair on the new system should be 90 percent, rather than the 75 percent proposed by the Administration.**

### *The Federal Bridge Program*

- The Administration bill would establish an apportionment program for functionally obsolete and structurally deficient bridges. A discretionary funding program would also be implemented for bridge projects on the National Highway System that exceed $10 million.

- During FY91, the federal bridge program received $1.63 billion. The Administration plan would authorize the following levels of funding for the bridge program over the life of the bill: FY92, $1.82 billion; FY93, $1.89; FY94, 2.0 billion; FY95, $2.22 billion; and FY96, $2.75 billion.

- Essentially, the level of bridge funding proposed by the Administration would be slightly above the level necessary to maintain the FY91 baseline if it was adjusted for a 5 percent annual increase in inflation. (Inflation-adjusted authorizations would be: FY92, $1.71 billion; FY93, $1.79 billion; FY94, $1.88 billion; FY95, $1.98 billion; and FY96, $2.08 billion.)

- Under the Administration proposal, the 80,000 lb. national maximum vehicle weight standard for bridges and the existing federal bridge formula would remain unchanged.

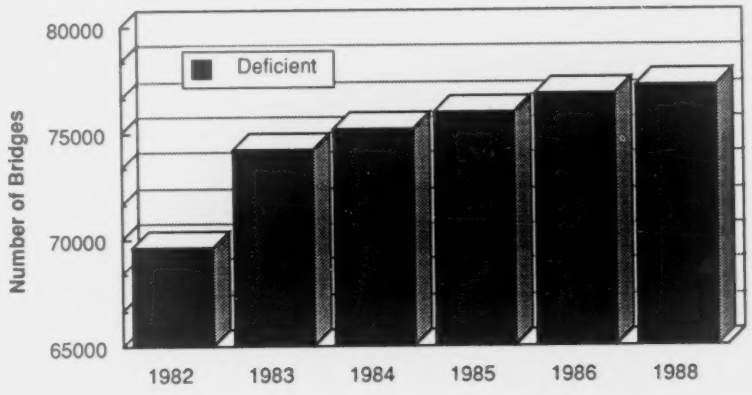
**ARTBA Position:**

- **According to U.S. Department of Transportation data, almost 30 percent of the bridges on the Federal-aid Highway System are either "functionally obsolete" or "structurally deficient." DOT estimates the cost to bring these bridges back up to standard is more than $50 billion.**

## "Structurally Deficient" And "Functionally Obsolete" Bridges On The Federal Highway System According To The U.S. Department of Transportation Report To Congress

**NUMBER OF DEFICIENT BRIDGES**

| 1982 | 1983 | 1984 | 1985 | 1986 | 1988 |
|---|---|---|---|---|---|
| 69,645 | 74,249 | 75,198 | 75,932 | 76,863 | 77,192 |



Source: *The Status of the Nation's Highways and Bridges: Conditions and Performance* Report of the Secretary of Transportation to the U.S. Congress. Part II, Page 6.

**To meet these needs, funding for the federal bridge program should be expanded to at least $5 billion per year so that all bridges on the federal system can be brought up to standard by the turn of the century.**

- **Each state should be required to develop a long-range plan that systematically addresses its bridge problems and assigns highest priority to repairing or replacing structurally deficient bridges.**

- **Set the federal/state funding ratio at 90/10.**

### *Urban/Rural Block Grant*

- In addition to creating a new "National Highway System," the Administration bill would replace the current Primary, Secondary and Urban System programs with a single Urban/Rural program. Essentially, roads and bridges that are currently on the Primary, Secondary and Urban Systems and not included in the new NHS would be eligible for block grant funding.

- The federal share of funding for highways included in the block grant program would only be 60 percent under the Administration plan. That compares to the current 75/25 matching ratio. As a trade-off for the smaller federal share, the Administration bill would allow the states to use the block grant funds for road and/or mass transit capital projects.

- The bill would also provide other flexibility to the states. Specifically, the certification acceptance program would be expanded. Under the Administration proposal, states would be able to certify, in advance, that all federal requirements would be incorporated in the project planning and approval processes. Thus, once the U.S. DOT had approved an overall state transportation plan, the states would have control over project selection and final approval.

**ARTBA Position:**

- **The current categorical programs for Secondary roads and metropolitan area street and highways should be maintained. Without categorical funding, many county road programs, particularly in states with aging mass transit systems, may see a reduction in the level of federal funds available for their utilization.**

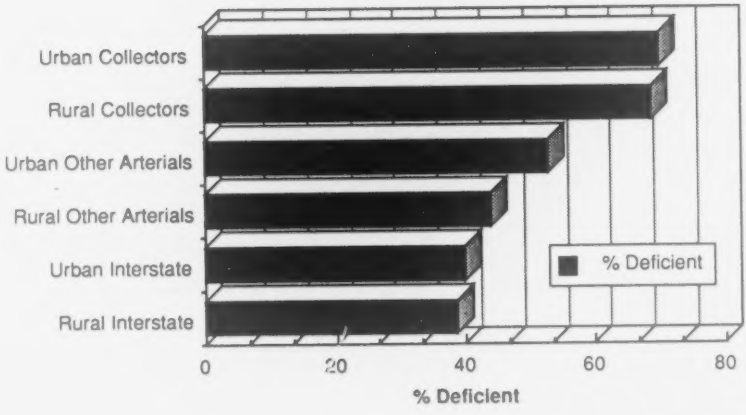
- **Nearly 70 percent of urban and rural collector roads and almost half of all other rural and urban arterials currently eligible for federal aid are in imminent need of improvements, according to the U.S. Department of Transportation's most recent report to Congress on the condition of the nation's highways and bridges (See graph on next page).**

  **To meet these needs, funding for the Secondary Program should be increased to $5 billion per year, with a 75/25 federal-to-state funding ratio.**

- **Funding for a new "Metropolitan Area Assistance Program" (Urban Program replacement that is designed to help alleviate congestion in urban/suburban areas) should be $4.5 billion per year, with a 70/30 federal-to-state funding ratio.**

## Federal Highway System Mileage In Imminent Need of Repair According To The U.S. Department of Transportation Report To Congress

**PERCENT OF MILEAGE DEFICIENT**



Source: *The Status of the Nation's Highways and Bridges: Conditions and Performance* Report of the Secretary of Transportation to the U.S. Congress. Page III-21, Table III-7.

## *Highway Safety Programs*

- The Administration proposal would increase funding for non-construction safety programs by $42 million beginning in FY92, while eliminating $330 million in annual funding for the two existing construction-related safety categorical programs.

- Currently, the Federal-aid Highway Program funds two construction-related categorical safety programs: one for hazard elimination, the other for improving rail-highway grade crossings. In FY91, these programs were funded at $170 million and $160 million, respectively. While these activities would still be eligible for federal funding under the Administration bill, the categorical programs for them would be eliminated.

  The current program also funds other construction- and non-construction-related safety activities. On the construction side, regularly apportioned highway funds may be used for safety improvements that are part of a reconstruction project or a sole safety improvement project. On the non-construction side, funds are provided for speed limit enforcement, and education programs on the dangers of drinking and driving and benefits of seat-belt usage.

- The Administration proposal would require states to spend a minimum 10 percent of their apportioned funds for the proposed National Highway System and the Urban/Rural Block Grant Program on construction-related highway safety improvements. The states would also be able to spend up to 5 percent of their Urban/Rural Block Grant funds for construction-related highway safety improvements to local and minor collector roads that are not a part of the federal system.

- The Administration bill would continue all existing non-construction safety programs and the sanction provisions for failure to comply with some federal safety mandates.

- The Administration also proposes to establish a new non-construction "Safety Bonus Program" that would be funded through a set-aside from the other highway construction and highway safety programs. To be eligible for the "bonus," states would be required to meet criteria established by the FHWA for improvement in 9 vehicle-related safety education or management areas. A minimum of $50 million would be made available to fund the "bonus" program.

- The bill would continue the National Highway Traffic Safety Administration research and development program with a $45.9 million authorization for FY92. NHTSA's research would be expanded to include Intelligent Vehicle Highway Systems.

**ARTBA Position:**

- **More than 45,000 Americans die on America's highways each year. Another 3 million are injured in accidents. And the nation is not now adequately addressing the unique highway visibility needs of an aging American population. For all of these reasons, federal highway safety funding should be increased to $2 billion per year.**

- **Continue all existing safety categorical funding programs including the Hazard Elimination and Rail-Highway Grade Crossings programs.**

- **Encourage each state to develop and implement a program that will lead to the systematic upgrading and maintenance of all traffic safety devices such as pavement markings, signage, impact attenuators and guide rail that fail to meet applicable performance and crashworthiness standards.**

- **Provide increased funding for training, education and certification for all personnel responsible for traffic control to enhance and improve safety and traffic movement in construction and maintenance areas.**

- **Require that products and services that enhance safety and improve traffic operations be included in criteria for all federal highway programs with a particular emphasis on the "3R" and "4R" programs.**

- **Prohibit the transfer of safety funds to any non-safety program.**

### *Public/Private Ventures*

- The Administration bill has several provisions that are designed to encourage private-sector participation in highway financing:

  (a) States would be allowed to use their apportioned funds for improvements to existing toll roads on the designated system and for the construction of new non-Interstate toll roads.

  (b) The proposal would permit the commingling of federal-aid with tolls and other public and/or private resources to construct new highways, reconstruct or replace existing free bridges and tunnels and reconstruct free non-Interstate highways that do not have fully-controlled access, in order to add lanes.

  To be eligible for federal construction assistance, the facilities would have to be be publicly owned, although states would be allowed to contract with private firms to design, finance, construct and operate a toll facility.

  (c) Limited indemnification of feasibility studies by private firms would also be eligible. Private participation in the state matching share would be allowed.

  (d) The bill would allow up to 35 percent of the funding for a toll road, bridge or tunnel to come from the federal government. Federal funds could be used for preliminary engineering on proposed public/private projects.

**ARTBA Position:**

- **Public, user-fee supported financing and the principle of awarding construction contracts through the competitive bidding process must remain the keystones of our national highway improvement program. In order to meet future transportation needs, however, no financing options should be overlooked. Public/private ventures in transportation have long been successful in Europe and should be thoroughly explored and implemented in the United States, where appropriate, with adequate safeguards for the competitive bidding process.**

### *Environmental Issues*

- The Administration bill seeks to minimize the environmental effects of transportation construction activity while, at the same time, assuring more expeditious federal environmental review and decision-making on projects. Mechanisms designed to improve coordination between federal agencies responsible for transportation-related environmental oversight are included in the bill.

- Eligibility rules for receiving federal funds to create wetlands banks or to fund state programs that create, conserve or enhance a wetlands habitat would be established under the Administration proposal.

- The bill would statutorily change the definition of the word "construction" to clearly allow the use of federal funds for wetlands enhancement and mitigation activities.

- Advanced acquisition of highway right-of-way would be encouraged to help minimize future consideration of environmentally-sensitive areas for highway routes.

Other environmentally-related aspects of the Administration bill would implement mandates of the new federal *Clean Air Act:*

— The Urban Transportation Planning Process would be changed to emphasize multi-modal considerations.

— Areas with a population of more than 200,000 would be required to initiate a Congestion Management System that is coordinated with the state's Air Quality Implementation Plan.

— Urban projects that offer innovative solutions to air quality and congestion problems can be given preferential treatment.

— Operational improvements on the NHS or Urban/Rural routes that help minimize congestion, such as the creation of High Occupancy Vehicle lanes, carpool projects, and signing and signalization upgrades, could receive a higher federal funding share than other capital investments.

— Urban areas with a population of more than 1 million that experience significant difficulty in meeting national air quality standards would be permitted to conduct operational tests of congestion pricing measures on federal-aid routes.

**ARTBA Position:**

- **Supports a streamlined and expedited federal environmental permit approval process for transportation construction projects.**

## *Research*

- The Administration bill would increase the federal investment in research and development programs by 110 percent, beginning in FY92, with annual authorizations rising from the current $49.4 billion to $104 million. New research emphasis would be placed on developing Intelligent Vehicle Highway Systems.
- The National Highway Institute would be continued with minor modifications.
- Three new University Transportation Center "Centers for Excellence" would be established beginning in 1992.

**ARTBA Position:**

- **Supports a $2 billion-per-year authorization for expanded federal highway research programs.**
- **Supports full-funding for the University Transportation Centers.**
- **Federal government should encourage—through special tax incentives and other means—private-sector research and development projects that have the potential to improve the quality, durability, safety and operation of the nation's highways and bridges.**

### *Disadvantaged Business Enterprise Program*

- The Administration bill would extend the DBE/WBE program through FY96 with no structural changes.

**ARTBA Position:**

- **The DBE/WBE program should be revised to ensure that it is aiding firms that are truly in need of assistance.**

### *Davis-Bacon Act Requirements*

- The Administration bill would raise the threshold for application of Davis-Bacon required prevailing wage rates from a minimum project size of $2,000 to a minimum project size of $250,000.

**ARTBA Position:**

- **Supports the Administration position on the Davis-Bacon threshold.**

### *Federal Aid for Mass Transit*

- The Administration bill would reauthorize the federal mass transit assistance program through FY96, with annual authorizations of $3.25 billion. This would represent no increase in funding above the FY91 baseline.
- Currently, about 40 percent of federal mass transit assistance is provide through the Mass Transit Account of the Highway Trust Fund. The remaining assistance is provided through the General Fund. The Administration bill would require that all federal mass transit assistance be provided through the Highway Trust Fund. This policy decision would result in a spend down of the trust fund's current Mass Transit Account balance. It would not effect the trust fund's Highway Account.
- The Administration proposal would reduce the federal funding share for mass transit projects. The federal-to-state funding ratio for formula grants would be 60/40, rather than the current 80/20. Discretionary grants would have a 50/50 matching ratio, rather than the current 75/25. Planning grants would be funded at a 75/25 matching ratio, rather than the current 80/20.

**ARTBA Position:**

- **Supports an increased level of federal funding for mass transit capital improvements.**
- **Supports a spend-down of the Highway Trust Fund Mass Transit Account.**
- **Opposes reduction in federal-to-state funding matching ratios.**

## Highway Indicator Trends As Reported By The U.S. Department of Transportation

**PERCENT CHANGE**

Statement of William Leighty
on behalf of the
National Association of Governors' Highway Safety Representatives

before the
Surface Transportation Subcommittee
House Committee on Public Works and Transportation

April 18, 1991

I. **Introduction**

Good morning. My name is William Leighty and I am Deputy Commissioner of the Virginia Department of Motor Vehicles. I am representing the National Association of Governors' Highway Safety Representatives (NAGHSR) which, as you know, is the national association of state highway safety offices. Its members are appointed by their Governors to develop and implement their state highway safety program and to administer the federal highway safety grant programs for their respective states. The Association is primarily concerned about driver behavior issues such as impaired driving, occupant protection, pedestrian, bicycle, motorcycle safety, safety enforcement, and truck safety.

My remarks this morning will be directed at the Administration's reauthorization proposal, and I will also offer NAGHSR's suggestions for reauthorizing the federal highway safety grant programs.

II. **Analysis of DOT Highway Safety Reauthorization Proposal**

Mr. Chairman, NAGHSR's reaction to the Administration's proposed reauthorization is mixed.

On the one hand, the Association is very pleased that DOT has proposed only minor modifications to the Sec. 402 State and Community Highway Safety grant program (23 U.S.C. 402). We strongly believe that the 402 program has been a successful, effective one and has been a major contributor to the reduction in the nation's overall fatality rate. NHTSA and NAGHSR share the belief that the 402 program is the cornerstone for highway safety activities at the state level and that, without the federal grant program, very few states would have the ability or resources to undertake highway safety activities. NHTSA and NAGHSR also share the belief that the 402 program "ain't broke" and needs no fixing. We are gratified that the Administration's reauthorization position reflects that common belief.

We also believe that the Administration should be given kudos for suggesting the concept of a flexible bonus program which would provide additional incentives to states for enacting specific highway safety countermeasures. A flexible program for states that make improvements on a broad range of highway safety issues is an idea that NAGHSR has strongly endorsed. We believe that such an incentive program would eliminate the fragmented approach to highway safety which currently characterizes the federal incentive grant programs and would promote comprehensive highway safety planning and implementation at the state level. Such a program could positively motivate the states to act on highway safety matters without being just another entitlement program.

444 North Capitol Street, Suite 340, Washington, DC 20001
(202) 624-5874 FAX (202) 624-5445

We are also pleased that the Administration has eliminated earmarkings in the 402 program, has continued to require the minimum age twenty-one drinking age, and has required that states develop safety management plans as a condition of eligibility for highway construction funds.

Proposed Funding Levels

On the other hand, we are very concerned about and do not support the proposed funding levels, the impaired driving eligibility criteria, the specific highway safety bonus program that the Administration has proposed, and the proposed changes in speed compliance policy.

NAGHSR believes that DOT's proposed funding levels for the 402 program represents a significant step backwards for highway safety. The Administration has proposed that the NHTSA 402 program should be authorized at $115 million--an 8.7% decrease in the authorization level--and that the federal share should be dropped from 75% to 60%. The 402 program has not been funded at the full authorization level in the last **seven** years, so it is very unlikely that it would be funded at the authorized level in the future. If actual funding for the basic federal highway safety grant program falls below $100 million (excluding earmarked funds), then the funding will be so insufficient that states will not be able to maintain the achievements they have made in highway safety, nor progress further against increases in motor vehicle deaths and injuries which the National Academy of Sciences and others have projected for the future.

NAGHSR feels that the $115 million level is very inadequate given the enormity of the highway safety problem. In 1989, 46,900 people died in motor vehicle crashes--as many as were killed in the Vietnam War. In that same year, 1.7 million people were injured--140,000 of them permanently. This cost the nation a total of **$37 billion** in lost wages, medical expenses, welfare costs, and other costs. Despite the significant progress that has been made in highway safety over the last several years (as measured in the fatality rate decline from 5.2 to 2.1 deaths per 100 million miles of travel), considerably more needs to be done. More federal, state and local resources will have to be devoted to saving lives. In light of the rising balance in the Highway Trust Fund, NAGHSR believes that more resources could easily be devoted to highway safety.

We are also perplexed by the Administration's proposal to drop the federal share for the 402 program from 75% to 60%. It appears that the sole justification for this change is to ensure that the federal share is consistent with that proposed for the Urban/Rural program. NAGHSR strongly maintains that there is no reason for the federal share to be lowered since the 402 program is a seed money program. By the end of the third year of a highway safety project, all federal funding is eliminated and projects must be supported by non-federal funds. Most states require projects to have a declining share of federal funds over the three-year life of the project and an increasing share of state, local, and private sector funds during that time period. Unlike construction programs, the 402 program does **not** encourage state and local dependency on federal funds and **does** leverage state, local and private sector funds. It makes no sense, therefore, to lower the federal share.

Further, we believe that the proposed level of funding for the FHWA 402 program is inadequate. That program has been funded at a minimal level for ten years, and the Administration is proposing that the program continue at the same low level for each of the next five years. The Administration proposal ignores the growing importance the FHWA 402 program will have in the next decade. As the country's population ages and the size of the elderly population increases, there will be tremendous pressure to upgrade traffic control devices and enlarge traffic signs in order to improve safety for the aging population. Among other things, the FHWA funds can be used by states to purchase and maintain traffic signs and traffic control devices. More FHWA 402 funds will be needed, not less.

The sole increase in funding for non-construction highway safety grant programs is in the safety bonus set-aside. Total funding for non-construction programs would increase by $50 million a year above current spending levels for each of five years. (See attachment #1). Although total funding for the federal-aid highway bill would increase by $4.3 billion over five years according to the DOT proposal, funding for non-construction highway safety grant programs increase by only $500 million during that same time period. This represents only 5.8% of the total highway funding increase. Between FY 91 and 96, the federal-aid highway program will have increased by more than **$7 billion** if the Administration's proposal is enacted, yet the federal highway safety programs will receive an extremely small share of the additional funds. Non construction highway safety grant programs would continue to represent **less than 1%** of federal-aid highway funding.

NAGHSR is also extremely concerned about the Administration's proposal to level-fund non-construction highway safety programs over the five year authorization period. Funding for the NHTSA 402 program has not increased in the last seven years, as shown in attachments #2. Funding for the FHWA portion of the 402 program has not increased in the last ten years, as shown in attachment #3. In FY 91, funding for the federal-aid highway program increased by **$2.3 billion**, yet the federal non-construction highway safety grant programs did not receive **one penny** of the additional funds. If inflation were taken into account, funding for the federal highway safety grant programs would actually show a 30%-40% decrease over the last ten years. In effect, state highway safety offices have been forced to do more with considerably less.

Under the Administration's proposal, funding for the federal highway safety grant programs would continue to be "flatlined." (See attachment #4.) The NHTSA 402, FHWA 402 and the non-construction portions of the safety bonus set-aside would each remain at a constant level throughout the five-year authorization period. By contrast, the construction portion of the safety bonus set-aside would grow from $5 million in the first year to an astounding $130 million by the fifth year. By the end of the authorization period, the construction portion of the set-aside is almost double the non-construction portion. In effect, the proposed funding would tilt state administering agencies away from safety toward construction.

Impaired Driving Programs

NAGHSR is also very disappointed that the Administration did not make any changes in the two federal impaired driving incentive grant programs (23 U.S.C. 408 and 410) beyond the changes already enacted by Congress last year. The reauthorization of these programs presents a tremendous opportunity to restructure, streamline, update and target those programs on impaired driving countermeasures which will have the most impact at the state and national levels. We also believe that now is the time to replace stringent eligibility criteria with ones that are performance-oriented. This would give states the flexibility to meet national impaired driving goals in a way best suited to state needs, capabilities and resources. The Administration has chosen not to take advantage of this opportunity even though national organizations like NAGHSR and MADD support these changes.

Additionally, NAGHSR is very concerned about the proposed level of funding for impaired driving. The proposal ensures that $25 million will be spent on alcohol programs--exactly the level of current spending. Current authorization for the 408 and 410 programs is more than $50 million. Considering the fact that alcohol is involved in half of all motor vehicle fatalities, federal support for impaired driving programs should be considerably higher than current funding levels. We believe that $25 million for impaired driving is grossly inadequate and totally unacceptable.

Safety Incentive Program

NAGHSR is also very disappointed with the specific safety bonus set-aside proposal that the Administration has proposed. In order to qualify for safety bonus funds, a state would have to satisfy a number of eligibility criteria, including passage of key impaired driving laws and implementation of impaired driving programs, passage of mandatory occupant protection legislation, implementation of bicycle and pedestrian safety programs, etc. A state would be assigned credits for meeting particular criteria and would be given grants in proportion to their states' contribution to the Highway Trust Fund and to the number of points accumulated. $75 million of the bonus funds must be used for safety non-construction programs, but the remainder may be used for any program authorized under Title 23, including highway construction programs. It is our firm belief that none of the bonus funds above the $75 million earmarked portion, will be used for non-construction safety programs. In fact, in my own state, the non-earmarked funds are constitutionally required to be used for construction purposes.

A state will have to develop and implement a number of safety countermeasures in order to receive the safety bonus funds. In fact, the State Highway Safety Agencies (SHSA) are **already** advancing highway safety programs which would help the states qualify for the incentive funds. Yet, those same agencies would receive a relatively minor increase in federal highway safety grant funds while the state Departments of Transportation (DOT) would receive the lion's share of safety bonus incentive funds. In other words, the SHSA's would bear all the costs of qualifying for the incentive program yet receive very little of the benefits. The safety bonus program, in our view, is lopsided and inequitable.

The bonus program would also put tremendous pressure on state transportation agencies to take over the non-construction highway safety function in order to gain better control of the bonus grant funds. At present, only about one-third of the SHSA's are housed in state departments of transportation. Historically, state DOT's have been far more concerned about roadway safety than driver behavior. If the state highway safety programs were moved to the state DOT's, it is very likely that driver behavior programs would be given **less** attention at the state level -- not more. Although NAGHSR strongly supports the objective of encouraging SHSA's and state DOT's working much more closely together, we do not believe that the proposed safety bonus set-aside is the best way to accomplish this objective.

Speed Compliance

Finally, we are disappointed that the Administration's bill does little to address the issue of compliance with posted speed limits. The bill replaces the compliance formula with a simple self-certification requirement for speed monitoring and data collection and eliminates the earmarking for speed compliance on 55 mph roads without making it a funding priority or replacing it with any other speed public education or enforcement programs. Despite the fact that NHTSA's own studies have shown that increased speeds on rural interstates have caused an increase in the number of fatalities, DOT's proposal does little to address the problem. Taken together, DOT's proposal seems to be de-emphasizing the importance of speed compliance and backpedalling on the issue.

III. **NAGHSR's Reauthorization Recommendations**

Base Highway Safety Program

NAGHSR strongly believes that the 402 State and Community Highway Safety grant program has been a small but effective program and needs only minor fine tuning. In my own state of Virginia, the fatality rate has dropped from 5.11 to 1.70 deaths per 100 million miles of travel since the 402 program's inception, while at the same time, total vehicle miles of travel in the state have nearly tripled, the state's population has increased by 1.5 million, and the number of registered vehicles has increased by three

million. (See attachment #5.) Without the 402 program, I believe that this dramatic decline in the fatality rate could not have been achieved.

The 402 program has also been used in Virginia to successfully halt developing highway safety problems. Last year, for example, seven children were killed in motor vehicle crashes, six of whom were not in child safety seats. In August, we implemented a 402-funded, multi-part campaign to address the problem of child safety seat usage. We conducted a survey with law enforcement agencies and others in order to determine how well the state's child safety seat law was being enforced. We announced a media blitz on the issue in August and unveiled our "Please be Seated" campaign in February which encouraged citizens to report child safety seat violations to law enforcement agencies. We also doubled the number of hospitals involved in our cooperative safety seat program for indigent parents and increased our child safety-seat loaner program by one-third. As a result of these 402-funded interventions, child passenger fatalities are down to one this year.

Virginia has also successfully used 402 funds to leverage state and local dollars. If FY 90, Virginia used $80,000 in 402 funds to finance community traffic safety programs (CTSP) in three of its seven districts. These comprehensive programs target youth, senior citizens and adults and promote seat belt usage, child safety restraints, bicycle safety, defensive driving and alcohol and drug awareness. A unique feature of the CTSP's is that they rely heavily on volunteers and donated resources. The $80,000 in 402 funds was matched by $65,000 in state funds and an estimated $596,000 in volunteer time and incentives.

The Association would like to see the 402 program focused on the three major contributors to motor vehicle crashes: impaired driving, inadequate occupant protection, and speed. NHTSA should continue to identify national goals and programs (with the active participation of states and others) for each priority. Considerably more resources and attention will have to be devoted to speed compliance by NHTSA. These 402 funding priorities should be established through rulemaking and reviewed periodically, as is presently required. However, states should have the flexibility to fund highway safety countermeasures in other areas (such as bicycle safety, emergency medical services, community traffic safety programs) as long as they can identify and substantiate each highway safety problem and can submit an annual Highway Safety Plan (HSP) which outlines programs for addressing each problem.

We strongly recommend that traffic records should not continue to be treated under the 402 program as just another highway safety countermeasure. In fact, traffic records – highway safety data collection, reporting and analysis – are the basic infrastructure that supports federal and state highway safety efforts. Without adequate data, states cannot identify the most significant highway safety problems in their jurisdiction, develop an HSP that adequately addresses state highway safety needs and concerns, or evaluate the effectiveness of federally-supported state highway safety programs. Without adequate federal support, state highway safety data will continue to be incomplete and not uniform from state to state. In order to rectify these problems and place much higher priority on traffic records, NAGHSR recommends that 402-funded traffic records projects should be funded with a 100% federal match.

NAGHSR also strongly urge that the 402 program should be funded at significantly higher levels. If safety is such a high priority to the Administration and Congress, then it is time to match that rhetoric with funds. We recommend that the 402 program should be funded at $140 million in FY 92, rising to $200 million by FY 96. If this action is taken, it would restore the program to the level that it was in FY 81. We also urge that the federal share should statutorily be established at 75% and not be dropped to 60%.

With respect to the FHWA portion of the 402 program, we recommend that the program should be funded at $25 million in FY 92, with $5 additional million in each subsequent fiscal year. This action

45-155 O—91——60

would allow the program to be large enough to have an impact at the state level and would increase the program commensurate with the need to improve traffic control devices for the elderly.

This increase would also help accomplish a major objective of the Administration's safety bonus set-aside – to encourage SHSA's and state DOT's to work more closely together. Under the FHWA 402 program, the State Highway Safety Agencies and the state DOT's already work together to determine which projects should be funded. Proposed projects are included in the state HSP and are submitted to NHTSA for approval. With more FHWA 402 funding, there would be more reason for the two different state administering agencies to work together and no need to have a separate set-aside to encourage this working relationship.

Impaired Driving Incentive Funds

NAGHSR recommends that the 408 and 410 incentive grant programs should be merged into a single, more streamlined and targeted program. We suggest that the eligibility criteria should be limited to the five most significant impaired driving countermeasures that will truly make a difference at the state and national level. States would be eligible for incentive funds if they had:

1) laws which would make it illegal to have a .08 blood alcohol concentration (BAC);
2) laws which would promptly suspend a person's driver's license for driving while impaired;
3) laws which would provide swift punishment for impaired drivers either through mandatory jail time or a lengthy period of community service;
4) laws which would require the use of sobriety checkpoints;
5) a self-sustaining impaired driving program.

NAGHSR also recommends that states should be allowed to waive at least one eligibility criteria based the state's past performance in the impaired driving area. For example, since alcohol is involved is approximately half of all motor vehicle crashes, then the waiver could be based on the number of fatalities that are below the 50% level. States could be allowed to waive one eligibility criteria if the number of fatalities involving impaired drivers with BAC of .10 (the level at which a driver is deemed to be impaired in most states) or above were between 40% and 45% of all fatalities. States could be allowed to waive two of the eligibility criteria if the number of impaired driving fatalities were less than 40% of all fatalities. (States would be required to use fatality data as reported in the Fatal Accident Reporting System [FARS].) The performance-based waiver would give the states greater flexibility to address the impaired driving issue in a way best suited to state needs and resources. The waiver would give states credit for reducing the number of impaired driving fatalities in their state without penalizing them for failing to implement very specific programs or processes.

The Association urges that the impaired driving incentive program should be authorized for no less than three years at a level of $25 million in the first year and $50 million thereafter. The federal share for the program should be 75%.

Occupant Protection Incentive Program

NAGHSR recommends that a federal occupant protection incentive program should also be established. In the first year of the program, funds should be made available to states that have a mandatory occupant protection law for all front seat occupants of passenger vehicles as well as a mandatory motorcycle helmet law for riders of all ages. States should be eligible for additional laws in subsequent years if they satisfied specific occupant protection and motorcycle use levels in each subsequent year (e.g. 50% safety belt use and 75% motorcycle helmet use.) States would be required to use the incentive grant funds for the development and implementation of occupant protection education, training, public information and enforcement programs. NAGHSR recommends that this incentive

program should be authorized for not less than three years at a level of $25 million in the first year and $50 million thereafter. The federal share should be 75%.

Funding Proposal

NAGHSR would like to offer an option for funding all the non-construction federal highway safety grant programs. We recommend that all the non-construction programs should be funded by earmarking a portion of the federal-aid highway program for highway safety. A two percent earmarking of $15.829 billion (the Administration's proposed funding level for FY 92) would yield $318 million -- an ample amount to cover the costs of the non-construction highway safety programs. Future funding would rise and fall in keeping with the funding for the federal-aid highway program. This would ensure that safety is an integral part of the federal program, not just an afterthought.

Speed Compliance

In the surface transportation reauthorization legislation, we sincerely hope Congress will correct the problems caused by the national maximum speed limit compliance requirements. Current law considers states out of compliance if more than 50% of a state's motorists exceed the posted 55 mph speed limit. Noncompliant states may be forced to forfeit up to 10% of their primary, urban and secondary system funds. The sanctions do not apply to the forty-one states that have increased their speed limit to 65 mph. Furthermore, 55 mph states are required to monitor and report speed data to the Department of Transportation, while 65 mph are not.

This bifurcated approach to compliance has caused two inadvertent, potentially harmful consequences. For one, it has created a disincentive for states to retain their posted speeds at 55 mph and an incentive for states to raise their speed limits. Second, it has caused states with some of the lowest fatality rates in the nation to face severe sanctions for failing to promote highway safety. In NAGHSR's viewpoint, the current compliance formula is not working and needs to be altered.

NAGHSR urges Congress to address this inequitable situation by:

- requiring all states to monitor and report speeds on all Interstate miles and to submit speed-related statistics to the Department of Transportation. This would generate the necessary data with which to determine whether or not increased speeds adversely impact safety;

- developing a weighting scheme which would take into account the vehicle miles of travel within each state, the seriousness of the speed violation, the enforcement efforts undertaken by the state, and the relative safety of different types of highways. This would allow the formula to take other factors into account which affect speed compliance;

- giving the states maximum flexibility in the implementation of a compliance program, either by phasing in the compliance threshold over a multi-year period, or by adjusting the threshold by a fixed percentage (e.g. 10 percent) in order to compensate for monitoring and sampling errors. This would give the states the flexibility they need to adjust to a revised compliance formula;

- establishing speed incentives encouraging states to increase and strengthen their efforts to enforce the national speed limit instead of sanctions for failing to enforce it.

This approach is consistent with the one recommended by the Government Accounting Office in its 1988 report to Congress and with the approach that was earlier considered by the Surface Transportation Subcommittee. NAGHSR believes that it would eliminate the inequities in the current formula while encouraging greater compliance.

Mr. Chairman, this concludes my remarks. I greatly appreciate the opportunity to appear before the Subcommittee and express NAGHSR's views on highway safety reauthorization issues. The Association has had an excellent working relationship with you and your capable staff, and we look forward to working collaboratively with you as a reauthorization proposal moves through the legislative process.

*Attachment 1*

*NONCONSTRUCTION HIGHWAY SAFETY GRANTS*
*(in millions)*

| | FY '91 enacted | FY '92 requested | FY '96 proposed |
|---|---|---|---|
| NHTSA 402 grants | 114.65 | 115 | 115 |
| FHWA 402 grants | 10 | 10 | 10 |
| 408 Alcohol Incentive Grants | 25 | 0 | 0 |
| 410 Alcohol Incentive Grants | 5 | 0 | 0 |
| Safety Bonus Set-Aside (non construction) | N/A | 75* | 75 |
| TOTAL | 150 | 200 | 200 |
| DIFFERENCE | 50 | 0 | 0 |

**The safety bonus set-aside replaces the 408 and 410 incentive grant programs. The bonus program is authorized in four separate places in the DOT reauthorization in the following manner:*

| | (millions) |
|---|---|
| NHTSA 402 | 25 |
| FHWA 402 | 25 |
| 408/410 | 25 |
| TOTAL | 75 |

*Funds are aggregated and may be spent on for any 402-related purpose; however at least $25 million must be spent on impaired driving programs.*

STATEMENT

OF

R. V. DURHAM, DIRECTOR

OF

FREIGHT DIVISION

INTERNATIONAL BROTHERHOOD OF TEAMSTERS

BEFORE THE

SUBCOMMITTEE ON SURFACE TRANSPORTATION

REGARDING

1991 HIGHWAY REAUTHORIZATION

APRIL 18, 1991

Mr. Chairman, my name is R. V. Durham. I am Vice President and Director of the National Freight Division of the International Brotherhood of Teamsters. The Teamsters Union represents hundreds of thousands of men and women in virtually every sector of the trucking industry. The Freight Division, which I now head, represents more drivers of heavy trucks than any organization in this country.

In addition, the Teamsters Construction and Building Materials Division represents thousands of workers engaged in highway construction. The highway reauthorization legislation which this committee will consider will have a direct impact on the careers of those Teamster members.

It has been my privilege to appear before this Committee many times over the years, in my previous role as Director of the Safety and Health Department of the Teamsters Union. My present duties, which have included the negotiations for the recently concluded

National Master Freight Agreement, have certainly not diminished my concern for truck safety. In fact, if anything, they have brought into sharper focus the connection between economic considerations and safety practices in this industry. I am here today to talk about both of these types of concerns -- both truck safety and economic matters that affect our members in the trucking industry.

Before I relate our specific legislative concerns, I would like to update you on truck safety gains accomplished in the 1991 National Master Freight Agreement. The Teamsters Union has a history for nearly two decades, of using the collective bargaining process to gain significant safety and health gains for our members. In most cases, the Union and the motor carriers who are parties to this agreement have set the standard for safe operation in this industry. In many cases, the requirements of the National Master Freight Agreement far exceed protections afforded by Department of Transportation regulations.

This year we were fortunate in agreeing with the carriers to a number of safety and health gains important to our members. Two of these are related to double trailer operations: Required safety procedures when it is necessary to pull empty converter dollies behind bobtail tractors; and language to assure that the snubbers, which take the play out of pintle hook connectors on doubles, will be in good working order. We also negotiated heated mirrors, which are important to our members who drive in winter weather conditions. Additionally, the carriers agreed to phase out diesel forklifts to end significant health concerns for our members who work on freight docks.

**DEREGULATION IN THE 1990'S**

The position of the International Brotherhood of Teamsters on motor carrier regulation has been clearly stated over the last ten years in testimony before this Committee. Deregulation has spawned numerous bankruptcies, introduced mindless price-cutting, forced early retirement and unemployment on Teamsters, and ruined an industry with a proud heritage. The provisions of the

Administration bill and H.R. 1064 continues the march down this path.

Proponents of deregulation claim huge economic benefits to consumers and the American economy. However, they turn a blind eye to the continued bankruptcies and the lack of enforcement of the Motor Carrier Act of 1980 by the Interstate Commerce Commission. Safety problems, hazardous material incidents, garbage backhauling, uncounted hours of service violations, are the spoiled fruits of deregulation. The Administration and the Hastert bill only promise these benefits to intrastate commerce. We urge you to reject this ill-advised proposal.

**LONGER COMBINATION VEHICLES**

Mr. Chairman, the trucking industry is a highly competitive industry. If you increase truckers fuel costs, as is contemplated in the reauthorization bill, the motor carriers' ability to pass those costs on to shippers is limited. They have to find cost savings somewhere: either by cutting labor costs -- the wages,

pensions and health insurance benefits of our members; or by finding savings somewhere else in their operating costs.

This year the industry's response to the prospect of higher fuel taxes is: "Productivity Increases." Above all else, what they are really talking about is: Bigger Trucks.

Mr. Chairman, it is an open secret that there are elements in the trucking industry who are plotting a strategy to gain legislative approval, at both the federal and state levels, to greatly expand the use of longer combination vehicles on our nation's highways. I want you to know that the International Brotherhood of Teamsters opposes any such expansion beyond those states in which LCVs are presently permitted. Of course, we have a job security interest in this issue. But we also have several very serious highway safety concerns about triple trailer trucks and turnpike doubles (tractors pulling two trailers, up to 48 feet long each).

One very real concern of our members deals with the phenomenon

known by engineers as rearward amplification. This is the "crack-the-whip" effect, where a small steering adjustment by the driver is amplified with each trailer that follows it. Our members experience this with regular doubles -- two 28 foot trailers. This was such a significant issue that we have negotiated safety language in our National Master United Parcel Service Agreement and our National Master Freight Agreement to reduce the problem of rearward amplification of twin 28 foot trailers.

Mr. Chairman, you will hear a great deal about the safety record of longer combination vehicles in the few states where they are now permitted. Primarily, these vehicles operate in the western U.S., on routes where there is relatively light traffic. We do not believe that the same safety record would be possible in other states that are more densely populated, or where road structures are not as modern as those in the West. The handling characteristics of longer combination vehicles, which can be forgiven to an extent on wide open, lightly traveled roads, will be

less tolerable in more demanding environments where there is less margin for error. For example, our members who operate triple trailers on the Kansas Turnpike do not make as many evasive actions and quick steering maneuvers as our members who drive on the New Jersey Turnpike. If the door is opened for these longer combination vehicles, this crack-the-whip effect which results from such maneuvers will take on a whole new dimension. Other safety problems like trailer sway would also be more serious on more crowded highways.

One safety concern among our members who are currently operating triples out West is that many of the tractors used to pull triples do not have enough power to maintain the minimum speed on grades. If this is a problem on relatively open, lightly traveled highways, it will be a much greater problem if longer combination vehicles are allowed in densely populated states, where there are more cars and trucks on the highways and fewer opportunities for other drivers to maneuver around slow moving

trucks safely.

Mr. Chairman, brake timing, balance, and adjustment are critical safety issues on all heavy trucks. These concerns become magnified on longer combination vehicles. The longer the vehicle and the more trailers involved, the more difficult brake maintenance for the entire combination becomes. This will be especially significant when combination vehicles come from different companies and are maintained by different mechanics.

Anti-lock brakes on both tractors and trailers could reduce the safety concerns related to braking performance of longer combination vehicles. But frankly, Mr. Chairman, given the track record of this deregulated industry, we are not optimistic that those who are seeking "productivity" increases would be willing to make the necessary investments in the safest equipment.

Mr. Chairman, over the past few years we have seen the truck size commitments of the Surface Transportation Assistance Act almost completely undermined. In the process, shipper and motor

carrier interests have perfected a state by state legislative strategy that we believe is about to be repeated.

The Surface Transportation Assistance Act provided a uniform maximum trailer length of 48 feet, with relatively few exceptions. Instead, the reality today is that we have virtual uniformity on a maximum trailer length of 53 feet. There are more states with trailer lengths beyond 53 feet, than there are states which still adhere to the 48 foot length. And those remaining states are under tremendous political pressure from industry and shipper groups to adopt the 53 foot rule.

This has been possible because of the abuse of equipment grandfathering provisions, and because shipper and trucking interests were able to go to state legislatures one-by-one and achieve a kind of domino effect by the use of economic blackmail. These states were threatened with loss of business and jobs, because shippers would locate in neighboring states with a more favorable transportation environment that included 53 footers.

I believe that this is the same kind of scenario that we can

expect to see played out in the states in the next few years -- except that the object of industry's desire will not be longer single trailers, but longer combination vehicles: triples and long doubles. The industry request of Congress will not be in the nature of a national mandate of these vehicles, but instead they will request a few seemingly modest adjustments in the laws to allow individual states the "flexibility" to "make up their own minds" on these matters.

But in reality, this flexibility coupled with tremendous localized political pressure will leave us with a nationwide network of triple trailers or twin forty-eights.

Mr. Chairman, we urge you not to adopt such a permissive approach to this very serious matter of highway safety. Individual state governments have neither the resources nor the legal authority that they would need to implement laws and safety regulations which would be needed to mitigate the safety risks associated with these larger trucks. Please, do not give the states the burden of trying to deal with demands for long

combination trucks one-at-a-time.

## THE MOTOR CARRIER SAFETY ASSISTANCE PROGRAM

The reauthorization of the Motor Carrier Safety Assistance Program (MCSAP) will before your Committee this year. This is clearly one of the greatest success stories among recent truck safety initiatives. The Teamsters Union is proud of its consistent support for this program. We hope that Congress will fund it a significantly higher level in the coming years. Additional funding should be utilized to increase the number of roadside truck safety inspections that occur across the country.

Mr. Chairman, we are well aware that there is some sentiment for redirecting the MCSAP to tasks different from those at which MCSAP has proven so effective. This troubles us a great deal. If Congress feels that more traffic enforcement or drug enforcement is desirable, those initiatives should be funded separately.

We do see an appropriate role for MCSAP in enforcement of certain Commercial Driver's License requirements. This is a natural extension of current MCSAP enforcement of driver requirements such as possession of a current log book, possession of a DOT medical card, and compliance with hours-of-service regulations. However, as MCSAP expands its examination of the driver, we must remind you that the driver is an extension of the motor carrier. It is the motor carrier who determines the qualifications of the drivers it employs. It is the motor carrier who holds the economic power over whether a driver accepts a vehicle or a load. It is the motor carrier who can influence a driver's speed or adherence to hours of service regulations. The people who hold such power should ultimately be responsible for safe operation of their employees and vehicles. Therefore, if you decide to assign new driver-related functions to the MCSAP program, we urge you to keep the enforcement focus on the motor carrier. Do not let an expansion of MCSAP slip into something that becomes punitive to drivers.

Mr. Chairman, we wholeheartedly support DOT's efforts, through the MCSAP funding process, to insure that states adopt safety regulations for intrastate trucking that are compatible with the Federal Motor Carrier Safety Regulations. We believe that DOT has successfully used MCSAP funding as a carrot to persuade most states to effectively regulate intrastate trucking. However, there is room for improvement: When faced with a disagreement over state compatibility, DOT has in some cases been too quick to "blink". The most blatant example of this problem is the hours of service regulations in California. While California's MCSAP inspectors enforce federal hours of service regulations in interstate commerce, they must pass intrastate drivers who often have much more driving and on-duty time. This occurs because California permits its intrastate drivers to drive a full two hours longer per work shift. California allows an extra hour of duty time per shift. And California has no limit at all on the maximum number of hours that intrastate drivers can be on duty in a single week. As a consequence, our members in California intrastate commerce

complain of being required to drive in a fatigued condition. Our California local unions report that some other intrastate drivers, without the benefit of a union to represent them, are required to work even longer hours than our members. An intrastate driver can legally drive, in some cases, after working 100 hours in a week's time. This dual system poses a serious safety hazard to our members and the motoring public.

We also feel that DOT at times is excessively permissive in terms of what they accept as compatibility with the Federal Motor Carrier Safety regulations. Again, differences in hours of service regulations provide the most glaring example. DOT considers a state's hours of service rules for intrastate drivers to be compatible if that state allows intrastate drivers as much as twelve hours per shift of driving time, compared with ten hours for interstate drivers. Those extra two hours behind the wheel are more than a technical difference. They pose a serious safety hazard.

15

**DRUG TESTING**

Mr. Chairman, the International Brotherhood of Teamsters has been working together with many of the largest motor carriers for the past six years on a collectively bargained program of drug testing for truck drivers. The program that we have developed, which provides not only for drug testing but also for rehabilitation of drivers who admit to having a substance abuse problem or who test positive, is a reasonable and balanced response to the danger that illegal drug use poses in the trucking industry. I want to mention two aspects of this program about which we are especially proud: (1) Our carriers contains a number of features which surpass government requirements in protecting the rights and interests of our members. (2) Only a very small number of our members -- as low as two or three out of every one thousand drivers -- test positive. I believe this says a lot about the character and professionalism of Teamster drivers, especially compared with other segments of this industry and the work force as a whole.

I want to compliment the Department of Transportation on one particular aspect of their drug testing programs. That is the procedural rule, commonly know as the "Part 40 Rule," issued by the Office of the Secretary of Transportation. This provides detailed guidelines for work place drug testing programs on sample collection under proper chain of custody, how laboratories should analyze samples and report results, and how Medical Review Officers should perform their important roles in this process. The Office of the Secretary is to be commended for the job it has done in developing these practical and effective safeguards and procedures. We have recommended the use of this rule as a guideline in many work place drug testing programs that are not subject to the DOT regulations. In fact, the Teamsters Union is a strong supporter of Congressional legislation to mandate that procedures like those spelled out in the Part 40 Rule should be followed in all work place drug testing that takes place in any industry, throughout the United States.

I especially want to speak in favor of the role of the Medical

Review Officer, as outlined in the drug testing rules promulgated by the Office of the Secretary of Transportation. This requirement, to have a doctor who is knowledgeable about drug testing review all laboratory reports and discuss positive lab results with the worker before reporting to the employer, has been one of the most important innovations in drug testing in recent years. We believe that in our collectively bargained drug testing programs, having medical review officers review all drug testing results has significantly improved the quality of these programs, and protects of our members against being wrongfully accused of being drug users. We also believe that this medical review office step has greatly reduced the need for our grievance committees to deal with some of the highly technical questions that can arise in contested drug testing cases.

Another aspect of drug testing on which I want to compliment the Office of the Secretary of Transportation is with regard to the split sample procedure. When DOT first issued its drug testing rules, they did not specifically provide for a split sample. The

union and management asked the Department to reconsider and allow for the split sample drug testing procedure which was already in use in our collectively bargained drug testing program prior to the DOT regulations. To its credit DOT looked at our practical experience in the area, saw its benefits and made adjustments in their rules to accommodate us.

One area of the Federal Highway Administration's drug testing rules, that needs adjustment is the pre-employment drug testing requirements as they apply to drivers who work out of Union hiring halls. This has caused a lot of confusion and difficulty for our Local Unions and for the employers who use drivers referred from these hiring halls. There is just not a good fit between these rules and the working conditions of these drivers. These drivers may work a few days here and a few weeks there. Generally they have a pretty steady employment record in terms of their relationship with the hiring hall. We have asked the Federal Highway Administration to take another look at this problem.

Mr. Chairman, there are two serious omissions in the DOT drug

testing rules. One is the failure to require employers to implement real Employer Assistance Programs. EAP's provide workers with confidential counseling, evaluation of substance abuse problems for workers who test positive or who self-refer, and referral for appropriate treatment. The other is the failure to mandate an opportunity for rehabilitation without loss of their jobs for drivers who come forward on their own or who test positive one time. The International Brotherhood of Teamsters strongly supports rehabilitation and job retention rights.

Mr. Chairman, this concludes my testimony today. I want to thank you and the members of this Committee again for giving us this opportunity to share our concerns with you. This Committee has been a strong force for safety on our nation's highways. The International Brotherhood of Teamsters looks forward to working with you in the future on these matters of such vital concern to us all. If you have any questions, I will do my best to answer them.

# TRANSPORTATION INFRASTRUCTURE

## Department of Transportation Highway and Mass Transit Program Reauthorization Proposals

*Statement by*
Kenneth M. Mead,
Director, Transportation Issues
Resources, Community, and Economic
Development Division

*Before the*
Subcommittee on Surface Transportation
Committee on Public Works and Transportation
United States House of Representatives

Mr. Chairman and Members of the Subcommittee:

We appreciate the opportunity to present our views on the proposed Surface Transportation Assistance Act of 1991. This 5-year, $105 billion package would reauthorize highway and highway safety programs at $89.1 billion and mass transit programs at $16.3 billion. Our testimony today is based on ongoing and completed work at the Federal Highway Administration (FHWA), the Urban Mass Transportation Administration (UMTA) and the National Highway Traffic Safety Administration (NHTSA). We will focus on those aspects of the Administration's reauthorization proposal that concern future federal spending, consolidation of highway programs, increased funding flexibility between mass transit and highways, and the outlook for highway safety.

In summary:

-- Under the Administration's proposal, highway and highway safety programs would experience real growth--an increase in purchasing power when inflation is considered--over the next 5 years when compared to the funding provided by the Congress over the last 5 years. Mass transit funding, however, would decline in real terms compared to the last 5 years. Federal funding for transit assistance has declined in real terms by about 50 percent over the last 10 years.

-- Highway and mass transit authorizations could be increased above the Administration's proposal. Using Administration revenue projections for the Highway Trust Fund, highway and mass transit authorizations could be increased by $5.1 billion and $2.2 billion, respectively, above the proposed levels over the next 5 years.

-- Pressures for budget deficit reductions will likely dim the prospects of obtaining large increases in program funding

levels. For example, most increases in the highway program are planned for fiscal years 1994 and 1995. In 1995, the highway program will have to compete with all federal discretionary programs, including defense, for the limited funds available. Backloading the bulk of the proposed increases into the later years raises questions about whether the proposed increased spending levels will actually be realized.

-- If a significant reduction in the federal matching share occurs, we believe it should be phased-in over time. Some states and local governments, as well as transit authorities, may not be able to raise additional matching funds in the near future. Therefore, it may be difficult for them to realize the full benefits of the proposed federal funding increases.

-- Consolidating most categorical highway programs into a two-tiered system--an upper tier for highways of national significance and a lower tier for other federal-aid roads--would allow states greater flexibility to target their federal dollars to address their individual needs. However, more can be done to ensure that states adequately attend to Interstate preservation needs in the face of burgeoning Interstate capacity needs, and that bridge funds are targeted to the most deficient bridges.

-- We support a multi-modal investment strategy to address the nation's highway and mass transit needs. However, our preliminary work indicates that a number of obstacles need to be overcome to eliminate the biases that tend to favor highway project selection over mass transit. For example, it is generally easier to demonstrate the benefits of increased highway capacity compared with increased transit capacity. As a result, federal guidance will be needed to

assure both highways and transit have equal opportunities to take advantage of funding flexibility.

-- Existing state highway programs and NHTSA's Motor Carrier Safety Assistance Program will continue to be the cornerstones for the support of national highway safety efforts. However, significant strengthening of FHWA enforcement of motor carrier safety is needed to ensure safe operation of commercial vehicles.

PROPOSED FUNDING INCREASES WILL BE AFFECTED BY SPENDING CAPS AND OBLIGATION CEILINGS

Compared with the funding provided over the previous 5 years, and accounting for inflation, highway and highway safety program funding would experience real growth in the next 5 years, while transit funding would decline. The Administration proposes authorizations of $86.8 billion for highways between fiscal years 1992 and 1996, $16.3 billion for mass transit, and $2.3 billion for FHWA and NHTSA highway safety programs. Assuming that the Congress appropriates the same amounts authorized in the Administration's proposal, highway and highway safety programs would experience real growth of 3.8 and 14.0 percent, respectively, while mass transit funding would decline 16.6 percent.

Federal mass transit funding has steadily declined over the past decade. Annual federal funding for mass transit declined about 30 percent--from $4.6 billion in fiscal year 1981 to $3.2 billion in fiscal year 1991. When measured in constant dollars, funding for transit assistance has declined by about 50 percent over the last 10 years. To maintain the same purchasing power today that was provided by the $4.6 billion level in 1981, the present funding level would have to be about $6.4 billion.

45-155 O—91——61

As attachment I shows, the highway account of the Highway Trust Fund will accumulate $8.1 billion more than its commitments by the end of fiscal year 1996, assuming 2 additional years of revenue collections as required by the Byrd Amendment. As a result, highway authorizations could be increased over the proposed funding levels, using Administration revenue projections. FHWA has indicated that a safety cushion of about $3 billion is needed in the highway account to guard against unforeseen decreases in highway user tax revenues or inaccurate revenue projections. Therefore, an additional $5.1 billion could be authorized for highway programs while still providing for this cushion. Likewise, as attachment II shows, the transit account will accumulate $2.7 billion more than its commitments by the end of fiscal year 1996, assuming 1 additional year of revenue collections as required by the Rostenkowski test of the Byrd Amendment. This $2.7 billion would consist of $400 million in uncommitted funds and $2.3 billion in projected revenues under the amendment. Assuming a $500 million safety cushion, an additional $2.2 billion could be authorized between fiscal years 1992 and 1996.

However, pressures for budget deficit reduction will likely dim the prospects of obtaining the Administration's proposed spending levels. The Budget Enforcement Act of 1990 (BEA) established limits on both budget authority and outlays for discretionary program spending in fiscal years 1991 to 1995 to control federal spending and consequently budget deficits.[1] Highway, mass transit, and safety program spending may be provided

---

[1]In fiscal years 1991 to 1993 there are separate budget authority and outlay limits in 3 categories: domestic, international, and defense. In fiscal years 1994 and 1995, there are budget authority and outlay limits on total federal discretionary spending.

in the form of annual appropriations or contract authority.[2] Appropriations are subject to both budget authority and outlay limits (caps). While contract authority is not subject to the budget authority cap, traditionally obligations and outlays resulting from contract authority are determined by obligation limitations set in the annual Transportation Appropriations Acts. Contract authority outlays are therefore subject to the BEA outlay cap.

Since mass transit and highway safety programs contain elements that will be subject to BEA's limits on both budget authority and outlays between fiscal years 1992 and 1995, it is questionable whether the authorization levels proposed by the Administration will actually be realized. Similarly, highway program spending, which is provided by contract authority, will be subject to BEA limits on outlays. Most highway program increases are planned for fiscal years 1995 and 1996. In fiscal year 1995, a single domestic discretionary outlay limit will be in place. Backloading the bulk of these increases into the later years raises questions about whether the proposed level of highway authorizations will actually be realized.

The Administration proposes shifting the funding sources for a number of surface transportation programs from general revenue to the Trust Fund. UMTA would fund all mass transit programs from the Trust Fund, eliminating any use of general revenues. Although appropriations from general revenues have been the predominant source of federal funds for mass transit projects, the percentage of funding from the mass transit account of the Highway Trust Fund

---

[2]Contract authority is contained in federal-aid highway authorization acts and is made available to spend before an appropriation is provided. Contract authority is not included under the discretionary budget authority limit since that authority is provided by authorizing legislation rather than highway and mass transit appropriation acts.

has increased in recent years. Since 1983, when the Congress established it, about 30 percent of UMTA's funds have come from the account and the remainder from general revenues. UMTA projects that the mass transit account and interest would be sufficient to fund the $16.3 billion proposed through fiscal year 1996. Similarly, funding for NHTSA's Operations & Research program--which had been partially funded by the Trust Fund--will now be funded entirely from the Trust Fund, with proposed authorizations of $636 million over 5 years. FHWA's operations and research funds for its motor carrier safety assistance programs, with proposed authorizations of $246.6 million over 5 years, would also be shifted from general revenues to the Trust Fund.

REDUCTIONS IN FEDERAL COST SHARES FOR HIGHWAY AND TRANSIT PROJECTS SHOULD BE PHASED-IN

The Administration's proposal would shift a larger share of the burden of financing highway and transit programs to states and grantees in a number of areas. For example, the federal funding share for urban, secondary and a substantial portion of the primary system would be reduced from 75 to 60 percent, mass transit capital project shares from 80 to 60 percent, NHTSA safety formula grants from 75 to 60 percent, and motor carrier safety program grants from 80 to 75 percent.

Greater cost sharing promotes leveraging of scarce federal funds, and can encourage states and grantees to seek more cost-beneficial projects, explore more cost-effective capital investment alternatives, and minimize waste and misuse of federal funds. However, we believe that any reductions in the federal share, as the Administration proposes, should be phased-in over time. Increased matching requirements may make it difficult to actually realize the benefits of any proposed federal funding increases because some states and local governments, as well as transit authorities, may not be able to raise additional matching funds in

the near future. According to the National Conference of State Legislatures, 31 states face budget deficits in the current fiscal year. Virtually all of the states have raised gasoline taxes over the last 10 years to meet existing needs and may find it difficult to raise them again to meet the new matching requirements.

In addition, as attachment III shows, states already on average finance the construction and maintenance of 78 percent of our highways. As a result, states with relatively high gasoline taxes, large geographical areas and smaller populations, as well as those with weak economic bases, may face difficulties in assuming more financial responsibility through a significant reduction in the federal share for federal-aid highway projects. Finally, individual transit authorities could find reduced federal participation particularly burdensome and counterproductive to their efforts to attract riders if they must look to transit users, including the elderly and handicapped, to make up the difference.

Toll Financing Is Helpful But Is Not A Financial Panacea

We recently reported that the Toll Facilities Pilot Program has demonstrated that tolls, while not a financial cure-all, can help states increase the total amount of state funds available for highway construction and maintenance on selected federal-aid highways.[3] However, our work shows that keeping the federal financial participation on toll projects significantly lower than that set for non-toll federal-aid highway construction is important. A high federal share could lead to an overuse of tolls on the federal-aid highway system. A lower federal funding share for toll projects will most likely limit toll use to roads with a high volume of traffic that generate sufficient revenues to make them financially feasible. Therefore, while the use of toll

---

[3]Highway Financing: Participating States Benefit Under Toll Facilities Pilot Program (GAO/RCED-91-46, Dec. 17, 1990).

financing as an additional revenue source would benefit selected highway projects, we would caution against viewing this method as a panacea for federal-aid highway financing because of its potentially limited applicability.

## PROGRAM RESTRUCTURING BETTER FOCUSES FEDERAL ASSISTANCE BUT NEEDS STRENGTHENING

Our work suggests that the proposed restructuring of the federal highway program into two tiers--a National Highway Program (NHP) and an Urban/Rural Program--will better focus federal assistance on highways of critical importance to the nation. This contrasts sharply with the current program which provides federal assistance through several separately funded categorical programs including the Interstate, Interstate 4R (I-4R)[4], primary, secondary, and urban programs. In addition, through the increased funding flexibility offered, a restructured program will allow states to better target federal assistance to address their critical needs. The Administration's highway reauthorization proposal also addresses the need to draw states' attention to preservation of the Interstate Highway system by establishing a higher federal share for Interstate preservation activities compared with capacity enhancement activities. However, more can be done to ensure that (1) states adequately attend to Interstate preservation needs in the face of burgeoning Interstate capacity needs, and (2) bridge funds are targeted to the most deficient bridges.

### Program Restructuring Will Better Focus Federal Highway Funds

To better focus federal funds on highways important to the nation and maximize state flexibility in using federal highway

---

[4]Interstate resurfacing, restoration, rehabilitation, and reconstruction. These funds are used for Interstate preservation and capacity enhancement.

funds, the Administration's proposal would restructure the federal-aid highway program into an essentially two-tiered system. The first tier, the NHP, would consist of approximately 150,000 miles of highway, including the Interstate system and a portion of the primary highway system. The second tier would be funded by a new block grant--the Urban/Rural Program.

Our work has shown that consolidating program categories into a more flexible system would allow states to customize their spending of federal funds. We reviewed a demonstration program authorized in 1987 by the Congress in which five states--California, Minnesota, New York, Rhode Island, and Texas--were allowed to pool money from the urban, secondary, and bridge programs and use the funds on any one or a combination of the three programs.[5] At the time of our June 1990 report, we found that three states had taken advantage of the funding flexibility to target a substantial portion of their pooled funds towards a particular program area.[6] Our ongoing examination of states' use of transfers of funds between program categories further supports the benefits of a more flexible program. Currently states are permitted to transfer a limited percentage of their federal highway funds between certain program categories.[7] Thirty-five states have taken advantage of these provisions to transfer over $800 million over the last 3 fiscal years.

The Administration's proposed two-tier system would offer some of the flexibility currently sought by states through fund

---

[5]Transportation Infrastructure: States Benefit From Block Grant Flexibility (GAO/RCED-90-126, June 8, 1990).

[6]The remaining two states, which began participating later than the others, also expect to realize benefits during the remainder of the demonstration.

[7]For instance, currently a state may transfer 20 percent of its I-4R funds to the primary program. A higher percentage may be transferred with FHWA approval.

transfers. In particular, states would be permitted to transfer 15 percent of their National Highway Program funds to the Urban/Rural Program. Our work has shown that states have identified some of their more significant needs on roads which may be in the Urban/Rural tier and not the NHP. As attachment IV shows, most fund transfers occurring over fiscal years 1987-90 were from the Interstate 4R Program--which will be part of the NHP--to the primary highway program--a substantial portion of which will be placed in the Urban/Rural Program. Since states have identified significant needs on the primary highway system, we support the Administration's proposal to allow fund transfers to the lower tier.

No Assurance Exists That Interstate Preservation and Maintenance Needs Will Be Met

The Administration's proposed highway program recognizes the importance of Interstate preservation by allowing a 90-percent federal share for preservation-type activities as compared to 75-percent share for reconstruction. While this is an important step, it may not be enough. In 1989, the Department of Transportation (DOT) reported that $4.7 billion to $6.1 billion a year would be needed between 1987 and 2005 by all levels of government to address Interstate preservation and capacity needs. In addition, DOT estimated that between 1987 and 2005, up to 50 percent of these investment requirements would be for Interstate capacity enhancement in the form of major lane widening projects. Under the Administration's proposal, the states will continue to have wide latitude in selecting and programming preservation and capacity enhancement projects. In light of competing capacity enhancement and preservation demands, there are no assurances that the approximately $130 billion investment in the Interstate system will be protected.

The Administration proposes that if the Secretary of Transportation finds that states are not adequately maintaining the Interstate system, the Secretary may require states to program NHP funds to bring their Interstate highways up to adequate condition. However, FHWA has not established standards defining what constitutes adequate Interstate maintenance. In reviewing Interstate maintenance, we found that four of seven states reviewed had significant maintenance backlogs in areas that adversely affected the structural integrity of roadways and bridges and the safety of the motoring public.[8] FHWA certified that maintenance was adequate in these four states; however, we question the basis for such certifications in the absence of measurable standards. We agree that a single, uniform national standard would be excessively rigid and difficult to develop and enforce given the different climates, resources, maintenance practices, and levels of Interstate vehicle traffic between states. These standards must be flexible, and are thus best developed at the state level, as some states are doing. Developing maintenance standards would more clearly delineate the state responsibility to the Interstate Highway System, and greatly assist FHWA's efforts to ensure those responsibilities are fulfilled.

When we testified before this Subcommittee in April 1990,[9] we stated that the Congress might wish to consider redefining the range of activities eligible for I-4R Program funding to encourage states to give more attention to certain maintenance activities directed at preserving Interstate pavement, such as joint and crack

---

[8]We selected the 7 states to provide a variety of pavement conditions, geographic balance, and Interstate usage. These states account for over 22 percent of the total Interstate lane-miles and 34 percent of the nation's vehicle miles travelled.

[9]Preserving the Interstate System (GAO/T-RCED-90-68, Apr. 24, 1990).

sealing. The Administration proposes allowing states to use their National Highway Program funds for maintenance on the Interstate system. This proposal would give states much needed flexibility to select, from among the entire range of preservation activities, the most appropriate and cost-effective preservation treatments without the artificial constraints of federal funding eligibility. Timely preventive maintenance delays the need for costly I-4R projects such as rehabilitation and resurfacing. As such, expanding eligibility could ultimately delay or save federal preservation expenditures.

We will soon issue a report to the full Committee on state and federal efforts to maintain and preserve the Interstate Highway system, conducted at the request of the Chairman and Ranking Minority Member. We plan to identify several legislative and programmatic changes which the Congress may wish to consider as it deliberates the future federal role in preserving the Interstate system.

A Level-of-Service Methodology Would Better Target Federal Funds for Bridge Improvements

In 1989, DOT reported that 40 percent (about 238,000) of the nation's approximately 578,000 bridges were structurally deficient or functionally obsolete and that over $50 billion would be needed to bring them up to current standards. Since 1987, the federal government has authorized states to spend about $1.4 billion a year to replace or rehabilitate bridges. Under the Administration's proposal, apportioned bridge funds over the next 5 years will range from $1.6 billion to $2.3 billion a year.

The Administration has proposed that FHWA adopt a Level-of-Service (LOS) methodology to identify deficient bridges eligible for federal funding. Our ongoing work for the Senate Environment and Public Works Committee suggests that LOS is significantly more

effective in identifying deficient bridges than FHWA's current methodology--called the sufficiency rating--because it not only establishes adequacy criteria for bridges on different classes of highways, but gives more adequate consideration to traffic volume and detour length.[10] However, FHWA does not plan to take full advantage of the benefits that LOS can provide.

Under its LOS methodology, FHWA does not plan to gauge the magnitude of problems with each bridge by assigning a numerical score based on its deficiencies. Consequently, all deficient bridges that FHWA identifies as being eligible for funding will be considered equally deficient regardless of the extent of their deficiencies. If FHWA assigned each bridge a deficiency rating and ranked the bridges from most to least deficient, it could link the most deficient bridges with the available resources and categorize them by highway system. By using LOS to make this type of analysis, FHWA could provide the Congress more accurate information to target federal dollars to highway systems that have the most critical bridge needs.

Our analysis of the National Bridge Inventory using a LOS methodology shows that the Administration's proposal could better target bridge rehabilitation funds to areas of greatest need. The Administration proposes requiring states to spend between 10 and 25 percent of their federal bridge funds on local, primarily off-system, bridges. Our LOS analysis showed that 72 percent of the proposed bridge funding would be needed for NHP bridges, about 27 percent for Urban/Rural bridges, and only about 1 percent for local (primarily off-system) bridges. Thus 10 to 25 percent of the

---

[10]Functional classification groups streets and highways according to the service they are intended to provide. The hierarchy of functional classification consists of principal arterials (for main movement), minor arterials (distributors), collectors, and local roads and streets. The roads making up the functional classifications differ for urban and rural areas.

federal bridge funds is proposed to be allocated to those bridges that have about 1 percent of the need.

## OBSTACLES EXIST TO IMPLEMENTING MULTI-MODAL FLEXIBILITY

The Administration's proposal would provide greater flexibility to state and local governments in allocating federal funds between mass transit and highway projects. The proposal would allow a state to use its Urban/Rural Program funds for transit projects, and certain of its mass transit account funds for highway projects. We support a multi-modal strategy to address surface transportation infrastructure and congestion needs. However, several obstacles could threaten the success of multi-modal funding.

First, as we reported in 1988, the ability to successfully implement an intermodal strategy is not well served by DOT's practice of preparing separate budgets and needs studies for highways, bridges, and mass transit.[11] DOT's approach precludes the effective ranking of intermodal needs and development of an integrated transportation strategy. Therefore, the federal government's ability to successfully implement intermodalism may be limited by the lack of a long-term investment strategy.

Second, the preliminary results of our ongoing review for the Senate Environment and Public Works Committee suggests that the criteria used to assess highway and transit projects may not easily facilitate choices between the two modes. While DOT envisions a cooperative federal, state, and local planning effort between mass transit and highways, the criteria used to assess transit and highway projects may make it difficult to choose between the two

---

[11] Transition Series: Transportation Issues (GAO/OCG-89-25TR, November 1988).

modes. In general, highway criteria are oriented toward the movement of vehicles, while transit criteria are oriented toward the movement of people. To put it another way, transit's objective is to move people out of their cars, while a highway goal is to build roads that can accommodate more and more cars. It is generally easier to demonstrate the benefits of increased highway capacity over increased transit capacity because the benefits of constructing new highways or additional lanes are more visible and tangible than the benefits of acquiring additional buses. Guidance to the states on conducting such analyses between transportation modes may be needed to successfully implement highway/mass transit funding flexibility.

Finally, most of UMTA's assistance is provided directly to local transit authorities, while highway assistance is provided to the states. At the state and local levels, transit funding will remain primarily with urban areas and highway funding with the states. Coordinated planning and project selection between federal, state, and local officials will be difficult, and the mass transit industry is concerned that states will place greater attention and emphasis on highways to the detriment of mass transit. The Administration has proposed minimizing this by providing for a consistent federal share, 60 percent, between the mass transit capital program and the Urban/Rural highway program. Our ongoing work will evaluate this and other approaches. To avoid modal bias with highways and meet the flexibility envisioned in the proposal, it will be important to ensure that both highways and mass transit have equal opportunities to take advantage of funding flexibility.

KEY HIGHWAY AND VEHICLE SAFETY PROGRAMS WILL CONTINUE

The Administration's proposal will continue the State and Community Highway Safety Section 402 Program and the Motor Carrier Safety Assistance Program (MCSAP), which are aimed at improving

highway and vehicle safety and reducing highway fatalities. In 1990, the fatality rate was less than 2.1 per 100 million vehicle miles traveled--40 percent less than it was in 1980. Because vehicle miles traveled continue to increase, however, fatalities also will rise unless the rate is reduced even further.

Reducing the fatality rate and number of deaths will not be easy because of the 3.8 million miles of road and the randomness of highway accidents. Also, an FHWA official has acknowledged that neither the federal government nor the states currently have economical and timely access to the data needed to identify highway safety problems, effectively direct highway safety research, develop sound safety policy, and accurately determine the effectiveness of safety programs. The Administration's proposal does not specifically address how these data limitations will be overcome.

State Highway Safety Programs

The Administration proposes funding the Highway Safety programs (NHTSA and FHWA 402, alcohol incentive grants, and motor vehicle and traffic safety programs) at $1.6 billion for fiscal years 1992-96. After accounting for inflation, this represents a 6-percent increase over the previous 5-year period, divided evenly between fiscal years 1992-96. The federal matching share, however, would be reduced from 75 percent to 60 percent.

The Administration proposes a new program of Safety Bonus grants, which will be added to the existing section 402 state and community grant program. The bonus grants will be allocated to states that meet certain highway safety criteria, such as implementing a mandatory seat belt law, complying with federal alcohol incentive programs previously authorized in sections 408 and 410 of Title 23, and reducing the state fatality rate. We agree with the general principle of the federal government's

providing financial incentives to states for the adoption and implementation of various highway safety measures. While the safety bonus grant plan seems reasonable, conceptually we have two specific concerns with the proposal.

First, we are concerned about how state compliance with federal criteria will be measured, since our ongoing work for the Senate Environment and Public Works Committee has shown that program evaluation in the areas mentioned in the proposal is imprecise. For example, one bonus grant criterion relates to safety belt usage rates. The Administration's proposal states that the Secretary of Transportation will establish a qualifying goal (for those states not having mandatory safety belt use laws) that at least 70 percent of drivers and front-seat passengers are belted. In the absence of any discussion of how the criterion would be established, or what evaluation methodology would be employed, we question whether the Secretary will have any assurance that states are, in fact, in compliance. Our current evaluation of the effectiveness of safety belts and mandatory use laws indicates that there can be substantial variation in the results of belt usage surveys, depending on how, where, and when they are performed.

Second, we have noted a potential problem with using fatality rates as a safety bonus criterion, as the Administration proposes. Certain geographic or demographic factors affect state fatality rates independently of state highway safety efforts. For example, more than half of all fatal accidents occur on rural roads. States that have a high proportion of rural roads therefore are likely to have a high fatality rate relative to more urban states, irrespective of the content of their highway safety programs. Accordingly, we see an equity issue in that some states could automatically qualify for safety bonuses without any improvement in their highway safety program, while other states which traditionally have had higher fatality rates will have a difficult

time competing for those funds. Basing safety bonus funds on fatality rates seems to reward states for chance circumstances of geography and demographics.

Motor Carrier Safety

FHWA's motor carrier safety programs are involved with commercial truck and bus safety. FHWA provides MCSAP grants to states to reduce the number and severity of accidents involving commercial motor vehicles. The Administration's proposal would fund MCSAP and FHWA's motor carrier safety operations and research functions at $687 million for fiscal years 1992 through 1996, compared with $408 million for fiscal years 1987 through 1991. After accounting for inflation, this represents an increase of 39 percent. The Administration's proposal would also reduce the federal share of eligible MCSAP activities from 80 to 75 percent.

The Administration's proposal adds several new initiatives to MCSAP including truck size and weight enforcement, drug awareness and enforcement programs, and the design, development and implementation of a new commercial motor vehicle information system to account for vehicle registration fees and taxes. It is not clear at this time how much funding will go toward these new initiatives. However, we note that MCSAP will be funded at $60 million in fiscal year 1992, which is less than the fiscal year 1991 appropriation. This raises concerns about whether the existing levels for traditional safety activities in the states can be maintained, at least in the early years of the reauthorization.

The Administration's proposal continues existing federally mandated weight and length limits for trucks using interstate highways. It continues to grandfather-in permission for trucks longer and heavier than the federal standards (commonly known as longer combination vehicles) to operate in states where they were used prior to the federal standards. While not part of the

Administration's proposal, permitting longer combination vehicles greater access to the highways will be an emerging issue. At the request of this Subcommittee, we are reviewing longer combination vehicle safety issues, such as driver training and qualifications, state permit systems, and state methods to enforce size and weight limitations. Our final report will be issued in late 1991.

The Administration's proposal adds two provisions to provide uniformity in Interstate motor carrier standards. One relates to having a single location and uniform standards for registration of commercial motor vehicles and collection of fuel taxes with proportional sharing of registration fees and taxes among the states. The other proposal preempts state laws relating to interstate and intrastate rates, and routes or services of interstate motor carriers, thus providing uniform interstate and intrastate regulations. We believe both provisions have merit and could help reduce state and motor carriers' cost and paperwork and remove some long-standing trucking industry concerns. However, commercial vehicle safety could be compromised if some states choose to drop out of MCSAP rather than to have their intrastate regulations preempted. At least three states have indicated they would consider doing so.

MCSAP has contributed to improving motor carrier safety. However, we have found that FHWA's strategy for bringing carriers into compliance with federal safety regulations focuses on educating states and carriers rather than on follow-up and enforcement measures after safety deficiencies are found. For example, in our January 1991 report to this Subcommittee, we reported that, although 70 percent of the motor carriers which underwent FHWA's motor carrier safety review received less than a satisfactory rating, FHWA had not adequately implemented its

follow-up enforcement procedures to ensure that carriers corrected deficiencies in safety management controls.[12]

- - - - -

This concludes my prepared statement. I will be pleased to answer any questions you or other members of the Subcommittee may have.

STATEMENT OF
JOHN McQUAID, EXECUTIVE DIRECTOR
THE INTERMODAL MARKETING ASSOCIATION

BEFORE

THE SURFACE TRANSPORTATION SUBCOMMITTEE
HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

ON

REAUTHORIZATION OF THE FEDERAL-AID HIGHWAY ACT

April 18, 1991

Mr. Chairman, distinguished members of the subcommittee, I appreciate this opportunity to appear before you today to share the views of the Intermodal Marketing Association on the vital issue of reauthorization of the federal highway program. My name is John McQuaid and I am executive director of the association.

The IMA is a national association comprised of major railroads, stacktrain operators, shippers' agents, intermodal truck operators and intermodal equipment manufacturing and leasing companies. Our organization primarily is involved with domestic intermodal operations, with our members handling virtually all such shipments. However, the burgeoning growth of the global marketplace also has required our members to become increasingly involved in international transportation.

My being here today to discuss the highway bill represents a significant advancement for domestic intermodal transportation -- a coming of age, of sorts. While international transportation is recognized as being predominantly intermodal in scope, the U.S. during the last decade also has developed an extensive domestic intermodal network. This network often is viewed as an extension of rail or truck service rather than the viable, expanding segment of the transportation industry it has become.

I appreciate this opportunity to share intermodal's 1980s success story and to urge the Congress to adopt a highway measure which facilitates the continued growth of this increasingly vital segment of our nation's transportation system.

Both Transportation Secretary Skinner and Public Works Committee Chairman Roe have recognized the growing importance of intermodalism to U.S. transportation and logistics needs.

At an earlier hearing on the highway bill, Chairman Roe noted, "It is time for us to make an intermodal transportation system a national priority so we can improve our productivity."

Secretary Skinner, meanwhile, has provided much-needed leadership within the Department of Transportation by breaking down traditional barriers among the numerous modal administrations. These administrations previously had fostered the development of policy with minimal, if any, view toward its intermodal impact.

Both of these developments are enthusiastically welcomed in the intermodal community. To us, they represent validation from the highest levels of government, that intermodalism no longer is

the stepchild of the other surface modes, but rather represents an industry segment which relies on the strengths of each to deliver the nation's goods.

The government's acknowledgement of the vital role intermodal plays in moving the nations goods comes long after the marketplace has recognized its efficiency and flexibility. Since the last comprehensive look at our highway needs in 1982, the approach shippers and receivers take in moving their goods has changed drastically as they faced the challenge of assuring U.S. competitiveness.

The increasing importance of integrated logistics to the our competitive goals requires an intermodal approach to transportation issues. Modal resources need to be highly coordinated if we are to meet the nation's transportation needs in the most efficient and cost effective manner possible. Our research and development efforts should be geared to fostering this overall goal.

Mr. Chairman, the IMA has two concerns about the highway bill which I will address here today. First, I will discuss our belief that the highway legislation should facilitate intermodal growth, particularly through the funding of infrastructure improvements to port and major rail intermodal facilities. Second, I will share with the subcommittee the IMA's concerns on longer combination vehicles.

The IMA supports a multi-year reauthorization bill which fosters the need for better coordination among the nation's transportation modes and recognizes the vital role the nation's highways play in promoting competitiveness. A highway plan that facilitates intermodalism will help improve U.S. productivity and broaden market opportunities for U.S. goods both at home and abroad.

A multi-year bill also provides the states an opportunity to plan their highway projects with a greater degree of certainty. However, the success of their planning and execution is contingent upon two things: (1) the availability of currently unspent but dedicated reserves in the Highway Trust Fund -- an amount totaling between $11 billion and $17 billion, and (2) a commitment to similarly invest any additional tax revenues contemplated by this legislation.

In identifying and providing adequate funds for major highways to facilitate the flow of commerce, it is important to remember the significant role our roadways play in intermodal transportation. Most of the discussion about intermodal that I have heard in relation to the highway bill focuses on the need to improve port access for international intermodal shipments.

However, just as poorly designed, decaying, and congested roadways around ports contribute to the inefficient movement of import-export traffic and adversely impact the quality of life in nearby communities, they similarly impact the domestic intermodal arena.

Every week in this country, trucks pick up and deliver tens of thousands of containers at our ports. At major railroad gateways, such as Chicago, thousands of transcontinental intermodal shipments being transferred between railroads and others bound for local delivery ply urban streets and highways.

In most cities, major domestic railroad intermodal facilities often are located in older rail yards which rely heavily on local, often congested, roadways for access to primary highways and Interstates.

Remedies which focus on improving truck access to port facilities and terminals also should address similar problems affecting our domestic intermodal network. Our goal should be to make access to intermodal facilities and terminals more efficient by creating modern, dedicated roadways to handle truck traffic which presently overburdens a crumbling system of urban streets and highways. This macro approach to our facilities access problems is essential to achieving dividends of reduced congestion and pollution, greater energy efficiency, and improved quality of life.

While improved access to ports and rail intermodal facilities is essential to the continuing growth of intermodalism, widespread use of longer combination vehicles on the nation's Interstate highway system is not. Indeed, if there is one issue on the horizon that threatens the rosy future of domestic intermodalism, it is LCVs.

The concern about LCVs, of course, arises from the belief that the trucking industry will seek productivity gains to offset an anticipated increase in fuel taxes in the highway bill. Among the scenarios discussed is one in which truckers will seek to have language included in the bill permitting the states the discretionary authority to allow LCVs. Then, trucking interests will use their highly organized and well-connected state organizations to pursue their LCV goals state by state.

The current 80,000 gross vehicle weight limit makes the operation of LCVs uneconomic. But with a relaxed federal weight limit, as suggested by the trucking industry, LCVs with gross weights far in excess of 100,000 pounds soon would be plying the nation's highways, much to the detriment of the intermodal industry.

Intermodal trailer and container movements grew from 3 million loads in 1980 to more than double that figure by the end of the decade. While this growth is impressive, the competitive environment (vs. trucks) in our industry resulted in this business producing only marginal profits for the railroad industry.

Much of the business railroads handle in domestic intermodal service is extremely susceptible to truck diversion. Consequently, any Congressional action allowing LCVs would have a devastating economic impact.

Studies by the railroad industry estimate that just the initial impact of twin-48 foot trailers would mean a loss of 9 percent of all rail ton-miles and 52 percent of net operating revenues.

Intermodal is hurt far worse than average: railroads would lose 23 percent of intermodal traffic and 27 percent of intermodal gross revenues, if twin 48s were legalized.

The long-term impact of the lost net revenue would result in even greater intermodal diversion to truck. Rail intermodal is dependent on capital intensive fixed facilities. With the loss of over a quarter of intermodal revenues, many of these facilities no longer would be economically viable.

Work by Paul Roberts, a independent transportation economist, also confirms the disastrous impact of legalizing twin 48s. According to Dr. Roberts, even the intermodal industry's new and highly successful stacktrain business would not be immune from the effects of the broader use of these vehicles.

Mr. Chairman, this is not a pretty picture for an industry that was one of transportation's success stories of the 1980s. We believe that our nation's highway policy should promote the most efficient use of limited energy and environmental resources and encourage greater use of our under-utilized railroad assets.

Domestic intermodal transportation should be promoted by government policy, not threatened by it. Intermodalism involves the best combination of the nation's surface transportation resources -- the economy and efficiency of long-haul rail and the flexibility of short haul truck. And it does it all on less energy and while reducing highway congestion and air pollution.

Other considerations, aside from economics, also compel further evaluation of LCVs before they are authorized for broader use. The safety of LCVs in actual operations is still not reliably established, in spite of numerous studies, and in spite of their limited use in 18 states. Also, the extent of the national system that would need to be designated for their use,

the access and egress that would be needed and the impacts of this access on other highway traffic are real concerns.

Another major concern is the cost of providing the system, the access and egress and the marshalling facilities and, more importantly, a determination of who ultimately is going to pay for all this. Finally, the full impact on other modes of transportation and the determination of the net economic benefits of the outcome to the economy as a whole and to our nation's competitive posture is still unknown.

Intermodalism certainly must continue to play a vital role in our nation's transportation network in the next century if the U.S. is to maintain its position as a leader in world trade. It is time for government and industry to break with the conventional approach toward transportation policymaking and funding.

As currently structured, the system fosters infighting among modes and detracts from the goal of assuring that we have the world's most efficient and reliable transportation system. We need to avoid the strain of modal one-upmanship that our present federal subsidy system fosters. Our unwillingness to meet these vexing challenges will undoubtedly erode our efficiency and productivity at a time when both are needed to enhance our competitive position domestically and internationally.

We look forward to working with the Congress in fashioning a bill that promotes better coordination among the nation's transport modes and recognize the critical impact our highways have on our ability to compete.

###

1937

STATEMENT SUBMITTED BY HOWARD
MESSNER, EXECUTIVE VICE PRESIDENT,
AMERICAN CONSULTING ENGINEERS
COUNCIL

# LEGISLATIVE PROPOSALS FOR SURFACE TRANSPORTATION

before the

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
SUBCOMMITTEE ON SURFACE TRANSPORTATION
UNITED STATES HOUSE OF REPRESENTATIVES

by
JACK KINSTLINGER
for the
AMERICAN CONSULTING ENGINEERS COUNCIL

APRIL 18, 1991

AMERICAN CONSULTING ENGINEERS COUNCIL
1015 15th Street, N.W., Suite 802
Washington, D.C. 20005-2670

## STATEMENT OF JACK KINSTLINGER

Mr. Chairman, Members of the Subcommittee on Surface Transportation. My name is Jack Kinstlinger. I am President and Chief Executive Officer of KCI Technologies, Inc., a consulting engineering firm with more than 500 employees.

I am also Transportation Committee Chairman of the American Consulting Engineers Council (ACEC). ACEC is the largest national organization of independent consulting engineering firms. Its membership represents more than 5,000 firms with some 175,000 employees, who annually design over $100 billion in constructed public and private works. Our firms range in size from a single, experienced, registered professional engineer to corporations employing thousands of professionals who represent a diverse source of national and international engineering and scientific expertise.

ACEC is a founding member of the Rebuild America Coalition, comprised of over 40 public and private organizations committed to the infrastructure challenge. Rebuild's Chairman Mayor Maynard Jackson of Atlanta, who represents the U.S. Conference of Mayors, is

volunteering his time to help focus public attention on innovative ways to finance the refurbishment of the nation's deteriorating infrastructure. Others members include public leaders from the League of Cities, National Association of Counties, Council of State Governments and the American Public Works Association whose job it is to maintain, inspect, and plan for the building and rebuilding of our public facilities. They are supported by engineers, builders, financiers, contractors, and architects whose careers are dedicated to the highest standards of quality, safety, and cost-effectiveness. Rebuild America advocates increased investment in infrastructure, partnerships between all levels of government, incentives for innovative financing and use of emerging technology.

The consulting engineering community is extremely interested in the future direction of transportation in the United States. We have a stake in it because often we are the professionals that design new facilities, as well as develop the technology to cost effectively maintain and expand a wide variety of highway and transit facilities. Before there was a bridge, highway, road or transit system, there was an engineer who designed it. Additionally, the quality of our transportation system directly affects the nation's ability to do business. It affects the ability to attract employees and to retain

45-155 O—91——62

quality current staff in the country's firms. Like all businesses, the movement of our employees from their homes to the workplace and from our workplace to our clients and job site must be done in an efficient, safe, economical manner or we no longer remain competitive in the marketplace. The expansion and revitalization of transportation networks is critical to local and national economic development, as well as to our international competitiveness.

Thus, it is important, Mr. Chairman, that the views of consulting engineers be heard as we approach the reauthorization of a new program and I appreciate the opportunity to appear here today.

Congestion on America's highways and runways is taking its toll. Many of our roads, highways and bridges are in a deteriorating or substandard condition and getting worse.

- Nearly 2/3 of today's peak-hour traffic or urban interstate highways moves at under 35 miles per hour. Urban highway congestion cause over 2 billion wasted hours each year - equivalent to 1 million idle workers per year.

- By the year 2,005 traffic congestion will jump by 300% wasting some 7.5 billion gallons of gas and costing highway users $50 billion annually.

- Over 60% of our highways are in need of repair and over 40% of the nation's bridges are either structurally deficient or functionally obsolete;

According to many studies, the country should be boosting its spending on roads, bridges, and other infrastructure by as much as 50% to keep the U.S. economy competitive. Yet, public works spending, adjusted for inflation, has risen by only 15% over the past five years. The next five years, despite the Administration's Surface Transportation Reauthorization bill, doesn't promise much more. The Bush Administration is requesting $105 billion over the next five years for highways and mass transit. This works out to only about $5 billion a year over current spending levels. Compare this with Japan, where public works expenditures will run about $3 trillion over the next 10 years, or the commitment of the German Government to rebuild East Germany's infrastructure, at an annual cost of $65 billion per year for the next 10 years.

A recent study by Economist David Aschauer has clearly demonstrated the relationship between public infrastructure investment and private sector productivity. It is no accident that the U.S. with a public capital investment as a percentage of gross domestic product of only 0.4% has seen recent productivity growth of 1/2% per year. Contrast this to Canada, the U.K. and France that are investing about 2% of gross domestic product in public infrastructure and enjoy productivity growth of between 1 1/2% and 2% annually. Japan, with an investment rate of 5% is enjoying productivity growth of over 3%.

The American economy suffers when infrastructure investment declines. The damage, however, is not irreversible. The United States must renew its commitment to maintaining our transportation system as the finest in the world and prepare for the challenges of the 21st Century.

In discussing ACEC's recommendations for a new highway and transit program, I would first like to outline several general concepts supported by ACEC and many other organizations here today. Following these recommendations I will narrow my remarks to a few very specific concerns of the consulting engineering community.

**ACEC supports enactment of a 4 or 5 year bill by September 30, 1991. Consulting engineers join many other organizations to urge support for the following funding recommendations:**

1. **Increase Federal highway and transit spending levels beyond levels in the current Administration bill, fully utilizing the approximately $16 billion of unobligated balances in the highway and transit accounts of the Highway Trust Fund.**

2. **Return the 2.5 cents-per-gallon being deposited into the general revenue fund for deficit reduction as a result of last year's Budget Reconciliation Law, to the Highway Trust Fund for its intended use -- to improve and maintain our highway and transit systems. User fees should be used only for transportation purposes.**

3. **Remove the Highway Trust Fund from the Federal unified budget and make the Trust Fund, and its funding mechanisms, permanent to assure that all dedicated highway revenues are available now and in the future for improving our nation's infrastructure.**

4. **Eliminate the gasohol exemption.**

5. Increase federal investment in transit with continued commitment of both general revenue funds and user fees.

6. Increase funding for research and development, particularly in the field of Intelligent Vehicle-Highway Systems, to use our current roads more efficiently.

ACEC also supports Chairman Roe's "A Nickel for America" campaign, which would provide for an additional five cent-per-gallon gasoline tax increase to be deposited into the Trust Fund and used only for transportation improvements on a "pay as you go" basis.

To provide an effective alternative to traditional funding mechanisms, ACEC strongly supports the use of tolls where appropriate when financing the design, construction, operation, and maintenance of transportation facilities. The states should be allowed to place tolls on existing federal-aid highways without a requirement to pay back federal funds and to develop new toll highways using existing federal-aid on a reduced match basis or using new federal-aid funds on a revolving basis from unobligated Highway Trust Funds. We also support elimination of the requirement for removing tolls from a facility once

bonded indebtedness has been repaid. We strongly encourage federal participation in privatization projects.

And now, Mr. Chairman, I would like to focus on two very important concerns that consulting engineers face when working with State departments of transportation on federal-aid highway projects.

First, the engineering and design community appreciates the key role you played, Mr. Chairman, in successfully including a provision in the 1987 Highway Act which requires the states to use qualifications-based selection (QBS), and to negotiate a fair and reasonable cost to perform the work with the selected firm, when procuring A/E services under the Federal-Aid Highway Program. To many, this procurement process is better known as the "Brooks A/E Law". We continue to advocate the qualifications-based selection of A/E services which provides for the most cost-effective, timely and technically competent design work possible. We are disappointed that the Federal Highway Administration has not issued the final regulations to implement this provision four years after it was passed.

Following the selection process, however, consulting engineering firms are continuously faced with numerous and duplicative audits and

arbitrary restrictions on indirect cost rates. In many cases, these practices are affecting the ability of our firms to do work for the state highway departments.

Millions of dollars are being wasted on multiple audits of A/E firms by state highway agencies, because one agency is reluctant to accept the audit results from another agency. Many of our firms work in several states and are audited several times a year for the same information. Having each state separately audit the same firm is a financial and administrative burden to both the engineering firm and the state agencies.

The problem is further aggravated when state highway agencies establish arbitrary limits on overhead rates and refuse to accept the firm's AUDITED rates. Agencies should focus the negotiation stage on total cost, rather than individual cost elements, such as overhead rates.

The misplaced belief that overhead is a true measure of efficiency results in the government spending an excessive amount of time and money evaluating an illusory indicator of cost, since the classification of many costs as direct or indirect is primarily a decision of business management based upon established accounting principles. Flexibility

inherent in accounting procedures can lead to substantial changes to a firm's overhead rate, yet its total costs to provide services can remain the same. For example, computer costs and premium pay for overtime work could be billed as direct expenses or direct labor by one firm and as overhead by another firm, yet the total cost of service for each firm remains the same.

Remember, under QBS, the contracting officer negotiates a "fair and reasonable cost" to the government. As noted, a firm's overhead rate may not affect the determination of said "fair and reasonable cost."

ACEC, with the support of the design community, has developed a legislative proposal to address the problem of multiple audits and unnecessary limits on indirect cost rates. We urge the Committee to include language in the bill to establish a uniform auditing process requiring state and local agencies to negotiate, perform and audit design service contracts in accordance with the cost principles in the Federal Acquisition Regulations (FAR). Consistent with the FAR, contract negotiations and payments would be made on the basis of actual overhead costs. Under the proposal, agencies would also be required to accept current audits performed by other states, federal agencies or an independent certified public accountant. The uniform

audit approach would provide valuable cost-savings to the government, allowing resources, both time and dollars, currently being wasted on redundant audits to be directed toward tasks which are truly crucial in protecting government interest. Again, we strongly urge the Committee to include language in the bill to achieve these objectives.

The second important ACEC concern relates to seeking the Committee's support for expanded reliance on the private sector for engineering and design services. Quality, cost-effectiveness and timely completion of transportation projects are in direct relation to the extent to which public agencies contract out engineering, surveying, inspection, and design services to the private sector.

A public/private sector partnership in delivering transportation programs benefits the transportation agencies, the private sector, and the general public. Contracting out provides public agencies with greater flexibility. The agency does not have to increase staff for the peaks associated with the cyclical nature of transportation work. It also provides the public agency with a wide spectrum of experts, which may not necessarily be readily available with in-house personnel, and gives a state access to expensive computer and mapping equipment without having to purchase it. Contracting out helps the private

sector by providing work to the many firms offering transportation design expertise. It also benefits the general public because it delivers transportation programs on a timely and more cost efficient basis. Finally, by contracting out work to tax paying companies, the tax receipts of local, state and federal governments will be enhanced.

ACEC urges the Committee to include an additional provision in the 1991 Surface Transportation Act that would establish a "Private Sector Involvement Program" to provide an incentive for state transportation agencies to rely on the private sector for design and other engineering and technical services necessary for the development, operation and maintenance of roads and highways. Our proposal would not impose a new federal mandate on the States. Rather, a grant "reward" would be established for the most innovative and aggressive states in utilization of private firms for design services. The Secretary of Transportation would select those outstanding state private sector involvement programs for grants from the Secretary's discretionary funds. Since the grants would come from an existing program and funds already authorized and appropriated, the awards would not have an adverse budgetary impact. We welcome your endorsement of this concept as part of the Committee's bill.

In conclusion, the American Consulting Engineers Council strongly urges the Committee to endorse legislative language on uniform audits and contracting out as described in my testimony today to address serious concerns facing consulting engineers across the nation when providing services for State departments of transportation under the Federal-Aid Highway Program. ACEC looks forward to working with the Committee to develop legislation which will shape the future of our nation's highway and transit programs for the 21st Century.

Mr. Chairman, Members of the Subcommittee, thank you for the opportunity to appear here today. I would be happy to answer any questions.

**Statement**

**for**

**The National Stone Association**

**by**

**Mr. Kenneth D. Mulzer**

**NSA Chairman And Secretary, Mulzer Crushed Stone, Inc.**

**before**

**The House Surface Transportation Subcommittee**

**on**

**The Surface Transportation Assistance Act (H.R. 1351)**

**April 18, 1991**

Mr. Chairman, I am Kenneth D. Mulzer, Secretary of Mulzer Crushed Stone, Inc., in Tell City, Indiana. My appearance today is on behalf of the National Stone Association (NSA) where I serve as 1991 Chairman of the Board. With me is Mr. Paul Mellott, Jr., Executive Vice President of H.B. Mellott Estate, Inc., in McConnellsburg, Pennsylvania, and Chairman of NSA's Government Affairs Division.

The National Stone Association represents approximately 500 producers of crushed stone and the related industries that provide services and supplies to our producer members. Our Association represents companies that account for over 80 percent of the crushed stone produced in the United States and provide over 64,000 jobs. Stone is quarried in 70 percent of the counties in the country and 49 out of the 50 states. It is a $5.5 billion a year industry and is the largest non-fuel mineral extractive industry in the country.

We are both a major supplier to the transportation construction process and a user of the nation's transportation infrastructure. Approximately 86 percent of crushed stone is trucked directly to its end use from our quarries. In addition, much of the stone that is shipped initially by rail or barge will reach its final destination by truck. We share your and other members of the committee's concern with the need to develop efficient and effective intermodal links. Because of the location of our facilities, the vast majority of our employees must commute to their jobs by automobile so congestion is impacting employees on a daily basis as they go to and from their jobs.

We are vitally concerned as business people and citizens with the decline in the performance of our nation's transportation infrastructure. I have a two-fold purpose in testifying today. First, I wish to voice NSA's vigorous support for the timely passage of the Surface Transportation Assistance Act, HR 1351, at adequate funding levels to meet our nation's transportation needs. As you know from Mr. Mellott's letter of March 20, 1991 to you and

Congressmen Roe, Hammerschmidt and Shuster, our Association supports the funding levels you have proposed. Increasing federal transportation funding to $153 billion during the next five years more accurately reflects the federal responsibility for meeting the nation's mobility needs and returns trust to the Highway Trust Fund by employing user fee revenues for the purposes for which they were collected.

We agree that the time to rebuild America's transportation infrastructure is now. The American people are willing to pay the user fees to develop a safe and efficient transportation system. As you have clearly pointed out, if the nation is to prosper in a global economy, we must stop amassing surpluses in transportation trust funds and use the money to restore our infrastructure and create a transportation system that improves our productivity and enhances our competitive edge.

Let me also take this opportunity to thank you for the excellent article on this legislative issue you contributed to the April issue of Stone Review, our Association's bi-monthly magazine. As you noted "We can differ about the final cost, but to me there is no more universal trust than this: How we spend the money is as important as how much money we spend."

This leads me to my second purpose in being here today which is to tell the subcommittee about the new Aggregates Research Center that NSA is establishing in cooperation with the National Aggregates Association as a major private sector initiative. It will enhance the productive use of aggregates and ultimately the value they provide to travelers and taxpayers through their applications in the building, restoring and maintenance of our nation's roads, bridges and highways. Our industry has currently raised some $3.4 million for an Aggregates Foundation that will fund the Center. The Center will be located at a major university and provide an independent focal point for the development and distribution of basic and applied research on crushed stone, gravel, natural sand and other aggregates for all construction and highway end uses.

The Center will work closely with public agencies (Departments of Transportation, Public Works organizations, U.S. Corps of Engineers, etc.), other academic and industrial research and educational institutions, architects, engineers and leading corporations to ensure that the proper usage of aggregates, innovative end-use applications, durable construction and cost-effective paving procedures will be utilized.

In addressing the nation's infrastructure crisis, we face the issues of repairing the existing decay in our system, developing better methods for preserving our existing multi-trillion dollar investment in our roads and bridges and formulating new ways to build more road capacity with scarce dollars.

The Aggregates Research Center will provide a bold new approach to developing credible new information on the use of aggregates in all types of construction and highway applications. The Center will work to develop sound technical and scientific information about aggregate products, promote understanding of the factors influencing the properties of aggregates and of mixtures in which aggregates are used, provide information to federal and state user agencies for the design of improved structures utilizing aggregates, assist users in making knowledgeable choices in the marketplace, and to conduct educational programs for the transfer of research information to practicing and future engineers.

The bottom line for highway users will be better, more durable and hopefully safer roads and bridges constructed in the most cost-effective manner. We believe this investment by our industry represents the essence of what de Tocqueville called "self-interest properly understood."

**Summary**

Mr. Chairman, the Chairman of the House Committee on Public Works and Transportation, The Honorable Robert Roe summed up our situation very succinctly when he said, "While the

world has been changing around us and while our major economic rivals have been growing even stronger, we have not been preparing for the future."

The Surface Transportation Assistance Act provides Congress and the Administration with the opportunity to turn this situation around. The dynamic interaction between infrastructure investment, productivity, growth and the generation of new wealth will allow us to build the infrastructure the country needs based on user fee revenues.

In his book The Work of Nations Robert B. Reich points out that investment in wealth generating assets such as transportation infrastructure produces an expanding circle of economic growth that can impact the future of America's standard of living and ability to compete in a global market.

As you may have seen in the Monday, April 15, 1991, edition of Roll Call, NSA has joined with over 85 other companies and associations in an open letter which recommends that Congress:

1. Reauthorize the federal surface transportation program for four or more years prior to the September 30, 1991 expiration date;

2. Provide the necessary funding to meet the identified highway and transit needs, and provide for the spend-down of the rapidly accumulating balance in the Highway Trust Fund;

3. Restore to the Highway Trust Fund the 2.5 cent increase in the federal motor fuels user fees enacted in last year's budget reconciliation act; and

4. Provide for the permanent independent reauthorization of the Highway Trust Fund.

As an individual Association, we have endorsed the basic structure the Administration has proposed for providing federal-aid to the states through the National Highway System, the Urban-Rural Program, the Bridge Program, the use of toll roads and public-private partnerships to expand investment in infrastructure. In addition, we support the Administration's call for additional spending in the research and development area.

U.S. Department of Transportation Secretary Samuel K. Skinner should be congratulated on the outstanding job he has done in developing a National Transportation Strategy and formulating his proposed legislation. Clearly, they have done an excellent job in framing the policy debate.

However, the financial component of the Administration's proposal does not meet the nation's infrastructure needs or keep faith with the user fee concept. There can be no further build-up in the Highway Trust Fund. Existing surpluses should be used to finance needed projects. Further, the overall funding levels proposed by the Administration are inadequate. As mentioned above, we support the levels proposed by yourself and the other leaders of the Public Works Committee which would provide $21 billion for highways next year and $24.5 per year for the remainder of the authorization period. While we do not have a specific recommendation on matching ratios for each program area, long-term needs studies continue to show that even higher spending levels would be required to keep America's lead in mobility. Groups such as the American Association of State Highway and Transportation Officials have developed comprehensive programs multi-modal programs, that should be considered in establishing different infrastructure investment rates.

We do believe that the overall federal share for meeting our highway needs is more than 22 percent currently provided. The long term policy goal should be to restore the federal share to the previous level of approximately 30 percent. This expanded federal commitment needs to be matched by expanded efforts by state and local governments as well. DOT Secretary

Skinner has raised valid points concerning the role increased state and local financial contributions make in improving project selection and construction management.

Pat Choate began a good deal of the debate on America's infrastructure crisis with his book America in Ruins. Today, he notes that the criteria for competition in a global economy are price, quality, service, marketing and innovation. Transportation infrastructure impacts all of these factors. On behalf of the National Stone Association, I urge you and the members of the subcommittee to report out a bill that can move America into the 21st century and restore our competitive edge.

Thank you for your consideration of our views. The balance of our comments are included in my written statement which I submit for the hearing record.

I would be happy to answer any questions.

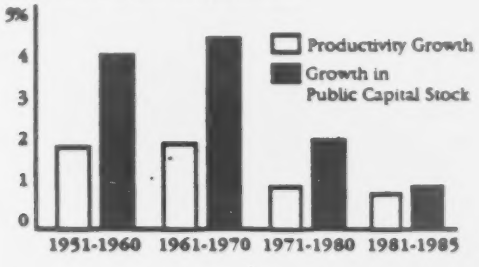
**Why America Is In Ruins**

By almost every measure, the U.S. has been reducing its investment in infrastructure. As a share of gross national product (GNP), spending on public capital has dropped from 2.3 percent of GNP in 1960 to less than 1.1 percent in 1985. The U.S. ranks 55th in the world in capital investment in infrastructure. It spends a smaller share of its resources on highway investments than Japan, which relies more heavily on rail transportation than does the U.S.

As noted by David A. Aschauer, former senior economist at the Federal Reserve Bank, the net result is a decline in U.S. competitiveness. "A root cause of the decline in the competitive position of the United States in the international economy may be found in the low rate at which our country has chosen to add to its stock of highways, port facilities, airports and other facilities which aid in the production and distribution of goods and services."

As shown in Chart 1, as the U.S. investment in infrastructure has fallen, so has its productivity. Other measures show a decline in infrastructure investment as well. Absolute dollar amounts invested in infrastructure when measured in 1972 constant dollars fell by 17 percent between 1964 and 1985. When measured on a per capita basis, spending has dropped by 40 percent since 1964. Perhaps the clearest way to demonstrate the decline in surface transportation infrastructure investment is to compare some numbers from the 1960s and 1980s. In the 1960s, 12 cents of every dollar spent on automotive transportation went toward roads. In the 1980s, only six cents of every dollar has gone toward the U.S.'s road network -- a 50 percent reduction at a time of escalating road use.

**CHART 1: U.S. Productivity Decline and Public Capital Accumulation**



Between 1968 and 1988, the private sector invested in new plants and equipment at a much higher rate than the public sector invested in infrastructure. Private-sector spending on capital rose from just over $4 trillion in 1982 to $7.3 trillion in 1988 while non-military public capital stock increased from $1.2 trillion to $1.7 trillion. The ratio of public to private fixed capital stocks sunk from over 30 percent in 1968 to approximately 23 percent by the end of 1988.

As Dr. Aschauer noted in a March 14, 1990, Wall Street Journal editorial, "Public Spending and Private Profit":

> Countries that sustain a high level of public investment relative to output experience higher productivity growth than other countries. For example, during the past two decades Japan has invested about 5.1% of output in public works and achieved productivity growth of 3.1% per annum while the U.S. has maintained a low public investment ratio of 0.3% and seen inferior productivity growth of 0.6% per year. A part of the explanation of the decline in the competitive position of the U.S. may be found in the low rate at which it has added to its stock of ports, highways, airports and other facilities that aid in the production and distribution of goods and services.
>
> Yet physical capital investment slid from 24.3% of total federal outlays in 1960 to 11% in 1990 and is scheduled to fall to 10.7% in 1991. Similarly, total federal investment has slumped from 34.1% of outlays in 1960 to 19.4% in 1990 and, if the president's proposed budget were adopted, would decrease to 19.2% in 1991.

Twenty years of underinvestment has led to the wearing out of the basic systems necessary to support economic growth.

**America's Changing Transportation Needs**

The 1980s have been the decade of the suburbs in terms of economic growth. Since 1950, 86 percent of the U.S.'s population growth has taken place in the suburban areas surrounding central cities. While Americans were deciding they liked the density of suburban living, they were also choosing to live in large metropolitan areas. By the mid-1980s, approximately half of the U.S. population lived in 35 areas with 1 million or more people, and one of three Americans lived in areas with 2.5 million or more people. (Seventy-five percent of all Americans live in metropolitan areas.)

In 1950, only 17 American metropolitan areas had populations of one million or more. These areas contained less than 30 percent of the nation's population. Jobs moved with population. Between 1960 and 1980, over 60 percent of all job growth took place in the suburban areas. In 1960, American suburbs had about 14 million jobs or 35 percent of the U.S.'s employment base. By 1980, the number of jobs had more than doubled to 33 million. Today, as we enter the 1990s, businesses in the suburbs employ 60 percent of all workers and are responsible for 67 percent of all job growth.

The impact of these trends can be seen in communities around the country.

> In Gwinnett County, 18 miles outside of Atlanta, the population has grown from 72,000 in 1970 to 250,000 in 1987.
>
> Oakland County, near Detroit, has been responsible for 40 percent of all job growth in Michigan since 1982.
>
> Tysons Corner, a sprawling Washington, D.C. suburb in Fairfax County, Virginia, has more office space than either Baltimore or downtown Miami.

> This growth in the number of people and jobs in new suburban locations has doubled commuting time and has led to rush hours in the New York metropolitan area that will last for 15 hours a day by 2000.

In addition to shifts in population and job locations, there continues to be a major social change in the composition of the work force, as the Eno Transportation Foundation Report, Commuting in America, points out.

> Between 1960 and 1980, the working-age population increased by 40 million, an increase of 38 percent, compared to an overall population growth of 26 percent.

> More than twice as many people entered the working-age group between 1970 and 1980 as did in the 1950 to 1960 period. Total population is projected to grow by another 40 million by 2010.

> In 1950, about one-third of working age women were in the labor force. By 1985, that figure had jumped to almost two-thirds. Of the 50 million new entries into the labor force since 1950, 30 million were women. Women represented only 28 percent of the labor force in 1950; today they exceed 44 percent. Furthermore, studies reveal that the trip patterns of women differ from those of men in that women tend to make more "chained" trips, involving travel, for example, to child care centers or shopping areas before and after work. The frequency of trips is also increased by the growth of part-time employment, particularly for women. Although these latter changes in the labor force may lessen recurring traffic congestion, they tend to increase traffic flows throughout the metropolitan area.

> In those metropolitan areas experiencing high rates of population growth in the 1970s, the growth in the number of workers was far in excess of population growth.

> Phoenix, the fastest-growing large metropolitan area in the nation, increased in population by 55 percent between 1970 and 1980. The worker increase was 80 percent, 25 percentage points higher.

This explosion of workers has led to an explosion in commuters, and the U.S. is more dependent that ever on the automobile. The U.S. is faced with a national gridlock problem that is threatening its quality of life and economic vitality.

**Updating for the 1990s**

While final data from the 1990 census are continuing to be formalized, it is clear that certain important trends impacting our transportation network are continuing. Perhaps the most important for this legislation is the continuing suburbanization of families and jobs and the shift in freight movements to new patterns of value movement versus bulk movement. Speed, flexibility and reliability are essential for a transportation system dealing with the new pattern of dispersed housing and work location that will be the key attributes to travel demand in the 1990s.

One of the clearest ways to understand the impact of this locational shift to suburbs is to recognize that only slightly more than 30 percent of all metropolitan travel is commuting to and from work. In fact, even at peak commuting hours, the amount of travel connected to commuting is 55 percent in the morning peak period and 37 percent in the night period travel. The continuing impact of part-time workers, two-job holders, a service economy and two income households is altering how we use and view our surface transportation network. For the foreseeable future, the main means for meeting our surface transportation needs will be developing safe, efficient and environmentally sound methods of accommodating and managing automobile and truck traffic. Transit can play a role in dealing with certain aspects

of journey to work trips. However, even if current transit ridership was to double from some 6 million to 12 million riders a day it would only equal 10 percent of all commuter trips and less than 1 year's increase in the growth of all trips.

**Consequences**

The infrastructure crisis can be measured in terms of physical decay of transportation facilities and in the social and economic impact of congestion.

Let me share with the committee some examples in both areas.

More than 60 percent of the miles of paved highways in the U.S. need some form of surface rehabilitation. In 1988, the U.S. Department of Transportation classified 43 percent of the interstate system pavement as either fair or poor. Operating costs are closely correlated with pavement conditions. Truck costs shoot up to 6.3 cents per mile when road conditions drop from "good" to "fair." Continuing current levels of highway funding will result in further deterioration of the highway system, resulting in an estimated $1,000 increase in vehicle operating costs per household. The relationship fortunately works the other way as well. Every $1 invested in highways reduces direct operating costs by $3 to $4. Today, 35 percent of the interstate system has outlived its design life.

Highway congestion already is serious in many areas, and the total number of miles travelled annually by vehicles will increase by one-third over the next decade to 3 trillion.

By 2005, traffic delays caused by inadequate roads will cost the U.S. $50 billion a year in lost wages and wasted gasoline. Continued neglect of infrastructure is also costing jobs

and increasing costs. The Port Authority of New York and New Jersey estimated that the region has lost 600,000 jobs as a result of infrastructure deterioration. In Pittsburgh, U.S. Steel estimated that it pays at least $1 million a year in additional costs to detour its trucks 18 miles around a major bridge closed by the state for lack of repair.

According to various Federal Highway Administration (FHWA) studies, congestion problems are growing throughout the transportation system. FHWA found that the percentage of urban interstate miles considered to be congested grew from 31.5 to 46.7 percent in the mid-1980s. In a 1983-85 survey of 37 metropolitan areas with a population of more than 1 million, traffic delays increased more than 90 percent in rural sections, about 50 percent in suburban areas, and 20 percent in central sections.

Traffic congestion imposes direct costs upon the individual by increasing personal travel time and vehicle operating costs in terms of fuel and motor oil consumption. For example, the California Chamber of Commerce estimated that traffic delays and rough roads cost motorists $135 a year in lost time and another $97 in fuel and maintenance costs. The Texas Transportation Institute estimated the 1986 per capita cost of congestion (user cost and additional fuel cost) at $330 without the added cost of higher insurance premiums associated with more congestion-related accidents, and $400 per capita including the insurance adjustments. Indirect costs, stemming from higher accident rates associated with driving in congested traffic, added vehicle wear and tear, degradation in the quality of travel, and higher insurance premiums, are more difficult to quantify.

Various organizations in Southern California have estimated that traffic delays amount to 300,000 to 485,000 hours per day for motorists in the greater Los Angeles area. According to a transportation official for Los Angeles County, the cost of these hours of delay is valued at over $507 million per year. The Southern California Association of Governments estimated the daily cost of recurring congestion in the Los Angeles region at over $7 million, using 1984 data and 1987 prices.

The trucking industry is also affected by congestion. According to FHWA officials, the total annual cost for trucks being delayed on freeways is between $4.2 and $7.6 billion, based on estimated vehicle operating costs combined with driver time charges of between $30 and $55 per hour. Losses on urban streets, docking areas and transfer stations may go as high as $23 billion. This does not include the opportunity costs from lost sales due to products not being available.

**Impact on Business Operations and Productivity**

There is a saying in business that nothing starts to happen until someone makes a sale. The corollary to that statement is that no job is finished until the product is delivered.

The declining quality of our highway infrastructure is impacting all aspects of business operations and by increasing costs and imposing delays that are hindering our ability to compete in a global economy.

TABLE 1

**Percent of Volume Shipped Just-in-Time by Industry**

| Industry | 1987 | 1990 | 1995 |
|---|---|---|---|
| Food | 25.5% | 31.3% | 34.4% |
| Chemical | 10.9 | 20.0 | 29.9 |
| Pharmaceutical | 7.2 | 15.0 | 22.2 |
| Automotive | 16.9 | 35.8 | 41.9 |
| Paper | 15.8 | 20.0 | 27.5 |
| Electronic | 23.2 | 27.2 | 31.3 |
| Clothing/Textile | 29.5 | 41.8 | 49.0 |
| Other Manufacturing | 23.5 | 28.7 | 34.8 |
| Merchandise | 6.3 | 10.4 | 12.1 |
| Total Response | 19.2% | 26.8% | 32.1% |

Source: Customer Service: A Management Perspective, Oak Brook: Council of Logistics Management, 1988.

As shown in Table 1, all aspects of American business are using just-in-time inventory procedures to reduce inventory costs and limit the amount of capital tied up in unproductive areas. This requires a transportation system that can respond in a reliable and predictable manner. To utilize plant and equipment and use labor more efficiently, firms are also using lower production run numbers. However, this process requires more deliveries of raw materials and subcomponents as well as additional shipments to customers. Increasingly, businesses of all sizes and in all sectors of the economy are investing in new information systems that provide them with fast and reliable data on the status of their operations. These new management resources cannot be translated into economic efficiencies unless we can move goods effectively.

Transportation is a significant component of the cost of all goods. On average, 20 percent of the final cost of goods is the result of transportation expenses. An inefficient transportation system increases costs throughout the economy because it has an impact on manufactured goods at all stages of the production process.

To be effective and efficient, the transportation sector needs the current infrastructure decay reversed. As pointed out earlier, the U.S. is annually suffering billions of dollars in losses from the current poor state of our infrastructure. We need to build new roads and expand our existing network to reduce current congestion problems and restore levels of mobility in our economy consistent with the standards that existed in the late 1960s and early 1970s. DOT has forecasted a 436 percent increase in freeway delays by 2005 if we do not act to expand capacity. Even using a more cautious forecasting approach, GAO (the Government Accounting Office) has estimated a 300 percent increase in delays. If these forecasts are allowed to come true, increased transportation costs could erode any other gains we make in improving manufacturing productivity and reducing costs in other aspects of manufacturing.

As the leading management expert Peter F. Drucker has pointed out, as an organization better controls direct production costs, indirect costs such as freight charges play an expanding role in your ability to compete.

Business is increasingly recognizing that the essence of automated production is a system organized around information. To fully utilize the benefits of an information-driven manufacturing process we need a support system that is reliable, efficient and cost effective.

The U.S. is not better able to compete if we eliminate manufacturing productivity gains through escalating transportation costs. It does management no good to have better information with which to plan and control its production funds and inventory levels if it cannot rely on the transportation network to deliver raw materials and or subcomponents to the plant and finished products to the customers in a timely fashion.

A sound transportation system is a precondition for a globally competitive economy. We need to build a transportation network with sufficient capacity to support our current requirements to move people and goods, provide room for future growth and create an environment that encourages innovation. To determine the proper level of infrastructure investment, we need to balance our engineering skills and construction capacities, our social and economic needs, a healthy concern for the environment and our ability to pay.

Statement by the
International Snowmobile Industry Association
to the
U.S. House of Representatives Committee
on Public Works and Transportation
Subcommittee on Surface Transportation
Regarding
Authorization of Post-Interstate Surface
Transportation Programs

Mr. Chairman, my name is Roy Muth and I serve as the President and Chief Executive Officer of the International Snowmobile Industry Association (ISIA), the trade association for the snowmobile industry. ISIA's members are manufacturers of snowmobiles, suppliers to the industry, snowmobile distributors and trail groomer manufacturers. I also serve as Chairman of the American Recreation Coalition's task force on trails. The American Recreation Coalition (ARC) is a federation of more than 100 associations and corporations representing the recreation/leisure industry and millions of recreationists. We appreciate the opportunity to comment on a subject that is very important to us: integrating the establishment of a national recreational trails fund into the reauthorization of surface transportation programs.

Since I am Chairman of the ARC task force, some of my comments will be generic in nature while others will specifically reflect the experience of the snowmobile community. Other task force members, representing both motorized and nonmotorized recreation interests, will also be submitting comments to the Subcommittee.

In recent years, the growth of trail-based recreation has been phenomenal. However, providing adequate trails to accommodate this growth has become increasingly difficult. Let me use an example from snowmobiling. Trails form the backbone of the sport of snowmobiling. In North America, there are now over 100,000 miles of signed and maintained snowmobile trails. In the United States, the greatest number of miles of trails is found in Wisconsin (13,600 miles), Minnesota (12,500 miles) and Maine (9,400 miles). However, virtually every state in the snowbelt has some snowmobile trails and the mileage is growing.

Currently, funding for snowmobile trails comes from two sources: state snowmobile registration fees and state gasoline taxes. In those states with extensive trail systems, trail funding runs into the millions of dollars. As an example, last year Wisconsin's program was funded at $3,500,000, Michigan's was funded at $2,500,000 and Minnesota's was funded at $2,300,000. However, we are finding throughout the snowbelt that these funds are not sufficient to meet the increasing expenses associated with snowmobile trail development and maintenance.

As you know, H.R.1155, the National Recreational Trails Fund Act of 1991, was introduced by Representative Thomas Petri to provide an additional source of funds for trail programs: a portion of federal gasoline tax monies. A copy of H.R.1155 is attached to my written statement as is a copy of a series of questions and answers on the bill prepared by the ARC task force. In view of

the fact that federal gasoline taxes are intended to be user fees, this legislation would allocate federal gasoline tax revenues derived from trail-related activities to the construction and maintenance of trails rather than highways.

Under provisions of this legislation, a National Recreational Trails Trust Fund would be established and monies would be transferred to this fund from the Highway Trust Fund. The amount deposited would be that attributed to the use of gasoline for off-road recreation and back country camping. The amount is set at one half of one percent of total annual Highway Trust Fund receipts, which would provide an estimated $75,000,000 annually. The program would be administered by the Department of the Interior.

Grants from the fund would be allocated to the states. Those monies could be used for:

- construction and maintenance of trails;
- acquisition of easements;
- acquisition of property from a willing seller when the objective of the acquisition could not be accomplished by other means;
- development of trailside facilities;
- operation of state environmental protection and safety education programs related to the use of recreational trails; and
- expenses incurred by the state to administer the program.

In discussions about this legislation, the question that is raised invariably is "Will the fund aid all trail interests -- motorized and nonmotorized?" The answer is an emphatic "yes."

Motorized and nonmotorized recreation must each receive the benefit of at least 30 percent of a state's allocated monies. In addition, 40 percent of a state's allocation must be spent in a manner which gives preference to project proposals providing for the greatest number of recreational purposes and for innovative trail corridor sharing to accommodate both motorized and nonmotorized uses. It is also important to note that not all trails funded under this program must be open to some or all motorized recreational activities. We seek to create more and better trails for all uses while recognizing that mixing some trail uses can be unsafe and reduce the quality of the experience.

We think that H.R.1155, the National Recreational Trails Fund Act of 1991, offers an important opportunity to improve trail-based recreation for Americans. In addition, because it involves the use of Highway Trust Fund monies, we think it would be very appropriate to incorporate the bill's provisions in the final legislation reauthorizing the Surface Transportation Act.

Once again, thank you for listening to my presentation. I'll be happy to try to answer any questions you may have at this time.

45-155 O—91——63

I

102D CONGRESS
1ST SESSION

# H. R. 1155

To set aside tax revenues collected on recreational fuels not used on highways for the purposes of improving and maintaining recreational trails.

---

IN THE HOUSE OF REPRESENTATIVES

FEBRUARY 27, 1991

Mr. PETRI (for himself, Mr. BEREUTER, Mr. BLAZ, Mr. CAMPBELL of Colorado, Mr. CLINGER, Mr. GOODLING, Mr. GUARINI, Mr. GUNDERSON, Mr. HUBBARD, Mr. HUGHES, Mr. HUNTER, Mr. KYL, Mr. MARLENEE, Mr. SENSENBRENNER, Mr. SCHIFF, Mr. SMITH of Oregon, Mr. THOMAS of Wyoming, Mrs. VUCANOVICH, and Mr. YOUNG of Alaska) introduced the following bill; which was referred jointly to the Committees on Ways and Means, Interior and Insular Affairs, and Public Works and Transportation

---

# A BILL

To set aside tax revenues collected on recreational fuels not used on highways for the purposes of improving and maintaining recreational trails.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,*

**SECTION 1. SHORT TITLE**

This Act may be cited as the "National Recreational Trails Fund Act of 1991".

**SEC. 2. FINDINGS.**

The Congress finds that—

(1) the Highway Trust Fund has successfully and equitably provided the means for improvements in and maintenance of the nation's highway infrastructure, such success being largely attributable to the Fund's "user-fee" structure, that being the directly proportionate relationship between the amount of highway use (as measured in fuel consumption) and the amount each user pays into the Fund;

(2) the "user-fee" concept requires that nonhighway fuels not be taxed to pay for highway benefits, a noticeable deviation from this policy being the taxation of recreational fuel not used on Federal highways.

(3) like highways, the national infrastructure of recreational trails and back country terrain must be constructed and maintained, but such construction and maintenance has historically received less than adequate funding;

(4) efforts to more perfectly apply a "user-fee" concept to the financing and maintenance of a national infrastructure, both on highways, and for recreational purposes off the highway, will likely enhance the success of both endeavors; and

(5) it is both equitable and prudent, for safety, environmental protection, and recreational reasons, to assure availability of financial means to maintain and

improve recreational trails and back country terrain by reserving for those purposes a portion of fuel use taxes imposed on fuels for recreational use not occurring on Federal highways.

SEC. 3. CREATION OF NATIONAL RECREATIONAL TRAIL TRUST FUND.

(a) IN GENERAL.—Subchapter A of chapter 98 of the Internal Revenue Code of 1986 (relating to trust fund code) is amended by adding at the end thereof the following new section:

"SEC. 9511. NATIONAL RECREATIONAL TRAILS TRUST FUND.

"(a) CREATION OF TRUST FUND.—There is established in the Treasury of the United States a trust fund to be known as the 'National Recreational Trails Trust Fund', consisting of such amounts as may be appropriated, credited, or paid to it as provided in this section, section 9503(c)(6), or section 9602(b).

"(b) EXPENDITURES FROM TRUST FUND.—Amounts in the National Recreational Trails Trust Fund shall be available, as provided in appropriations Acts, for making expenditures to carry out the purposes of the National Recreational Trails Fund Act of 1991.".

(b) DEPOSIT OF UNREFUNDED HIGHWAY TRUST FUND MONEYS.—Section 9503(c) of the Internal Revenue Code of 1986 (relating to Highway Trust Fund) is amended—

(1) by adding at the end thereof the following new paragraph:

"(6) TRANSFERS FROM THE TRUST FUND FOR NONHIGHWAY RECREATIONAL FUEL TAXES.—

"(A) TRANSFER TO NATIONAL RECREATIONAL TRAILS TRUST FUND.—The Secretary shall annually pay from the Highway Trust Fund into the National Recreational Trails Trust Fund amounts (as determined by the Secretary) equivalent to 0.5 percent of total Highway Trust Fund receipts, as adjusted by Secretary pursuant to subparagraph (B).

"(B) ADJUSTMENT OF PERCENTAGE.—

"(i) IN GENERAL.—Not more frequently than once every 3 years, the Secretary may increase or decrease the percentage of Highway Trust Fund receipts paid into the National Recreational Trails Trust Fund to more accurately reflect, in the Secretary's estimation, revenues received from nonhighway recreational fuel taxes.

"(ii) AMOUNT OF ADJUSTMENT.—The amount of an adjustment in the percentage stated in clause (i) shall be not more than 10

percent of that percentage in effect at the time the adjustment is made.

"(iii) USE OF DATA.—The Secretary shall make use of data on off-highway recreational vehicle registrations and use in making an adjustment under clause (i).

"(C) DEFINITIONS.—For the purposes of this paragraph—

"(i) NONHIGHWAY RECREATIONAL FUEL TAXES.—The term 'nonhighway recreational fuel taxes' means the taxes under sections 4041, 4081, and 4091 (to the extent attributable to the Highway Trust Fund financing rate) with respect to fuel used as nonhighway recreational fuel.

"(ii) NONHIGHWAY RECREATIONAL FUEL.—The term 'nonhighway recreational fuel' means—

"(I) fuel used in vehicles and equipment on recreational trails or back county terrain, including use in vehicles registered for highway use when used on recreational trails or back country terrain; and

"(II) fuel used in campstoves and other outdoor recreational equipment."; and

(2) by striking paragraph (2)(C) and inserting the following:

"(C) EXCEPTION FOR USE IN AIRCRAFT AND MOTORBOATS, AND AS NONHIGHWAY RECREATIONAL FUEL.—This paragraph shall not apply to amounts estimated by the Secretary as attributable to—

"(i) use of gasoline and special fuels in motorboats or in aircraft, and

"(ii) use of gasoline as nonhighway recreational fuel as defined in paragraph (6)(C)(ii).".

(c) CONFORMING AMENDMENT.—Section 6421(e)(2) of the Internal Revenue Code of 1986 (defining off-highway business use) is amended by adding at the end thereof the following new subparagraph:

"(C) EXCEPTION FOR USE AS NONHIGHWAY RECREATIONAL FUEL—The term 'off-highway business use' does not include any use as nonhighway recreational fuel as defined in section 9503(c)(6)(C)(ii).".

(d) CLERICAL AMENDMENT.—The table of sections for subchapter A of chapter 98 of the Internal Revenue Code of 1986 is amended by adding at the end thereof the following new item:

"Sec. 9511. National Recreational Trails Trust Fund.".

SEC. 4. NATIONAL RECREATIONAL TRAILS PROGRAM.

(a) IN GENERAL.—The Secretary, using amounts available in the Fund, shall administer a program allocating moneys to the States for the purposes of providing for and maintaining recreational trails.

(b) STATE ELIGIBILITY.—

(1) TRANSITIONAL PROVISION.—Until the date that is 3 years after the date of enactment of this Act, a State shall be eligible to receive moneys under this Act only if such State's application proposes to use the moneys as provided in subsection (d).

(2) PERMANENT PROVISION.—On and after the date that is 3 years after the date of enactment of this Act, a State shall be eligible to receive moneys under this Act only if—

(A) the State has established a State Recreational Trails Advisory Board on which both motorized and nonmotorized recreational trail users are represented;

(B) in the case of a State that imposes a tax on nonhighway recreational fuel, the State by law

reserves the revenues from that tax for use in providing for and maintaining recreational trails;

(C) the Governor of the State has designated the State official who will be responsible for administering moneys received under this Act; and

(D) the State's application proposes to use moneys received under this Act as provided in subsection (d).

(c) ALLOCATION OF MONEYS IN THE FUND.—

(1) ADMINISTRATIVE COSTS.—No more than 3 percent of the expenditures made annually from the Fund may be used to pay the cost to the Secretary for—

(A) approving applications of States for moneys under this Act;

(B) paying expenses of the National Recreational Trails Advisory Committee; and

(C) conducting national surveys of nonhighway recreational fuel consumption by State, for use in making determinations and estimations pursuant to this Act.

(2) ALLOCATION TO STATES.—

(A) AMOUNT.—Amounts in the Fund remaining after payment of the administrative costs described in paragraph (1), shall be allocated and

paid to the States annually in the following proportions:

(i) EQUAL AMOUNTS.—50 percent of such amounts shall be allocated equally among eligible States.

(ii) AMOUNTS PROPORTIONATE TO NONHIGHWAY RECREATIONAL FUEL USE.—50 percent of such amounts shall be allocated among eligible States in proportion to the amount of nonhighway recreational fuel use during the preceding year in each such State, respectively.

(B) USE OF DATA.—In determining amounts of nonhighway recreational fuel use for the purposes of subparagraph (A)(ii), the Secretary may consider data on off-highway vehicle registrations in each State.

(d) USE OF ALLOCATED MONEYS.—

(1) PERMISSIBLE USES.—A State may use moneys received under this Act for—

(A) maintenance of existing recreational trails, including the grooming and maintenance of trails across snow;

(B) restoration of areas damaged by usage of recreational trails and back country terrain;

(C) construction of new trails where a recreational need for such construction is shown;

(D) acquisition of easements;

(E) acquisition of fee simple title to property from a willing seller, when the objective of the acquisition cannot be accomplished by acquisition of an easement or by other means;

(F) development of trail-side and trail-head facilities that meet goals identified by the National Recreational Trails Advisory Committee;

(G) in an amount not exceeding 5 percent of the amount of moneys received by the State, operation of environmental protection and safety education programs relating to the use of recreational trails;

(H) development of urban trail linkages near homes and workplaces; and

(I) in an amount not exceeding 7 percent of the amount of moneys received by the State, administrative costs of the State.

(2) USE NOT PERMITTED.—A State may not use moneys received under this Act for condemnation of any kind of interest in property.

(3) GRANTS.—

(A) IN GENERAL.—A State may provide moneys received under this Act as grants to private individuals, organizations, city and county governments, and other government entities as approved by the State's Recreational Trail Advisory Board, for uses consistent with this section.

(B) COMPLIANCE.—A State that issues grants under subparagraph (A) shall establish measures to verify that recipients comply with the specified conditions for the use of grant moneys.

(4) BALANCE OF MOTORIZED AND NONMOTORIZED BENEFITS.—Not less than 30 percent of the moneys received annually by a State under this Act shall be expended for benefits directed to motorized recreation, and not less than 30 percent of those moneys shall be expended for benefits directed to nonmotorized recreation.

(5) DIVERSIFIED TRAIL USE.—

(A) REQUIREMENT.—To the extent practicable and consistent with other requirements of this section, a State shall expend not less than 40 percent of moneys received under this Act in a manner that gives preference to project proposals—

(i) which provide for the greatest number of recreational purposes including, but not limited to, those directed under the definition of "recreational trail" in subsection (f)(5); and

(ii) which provide for innovative recreational trail corridor sharing to accommodate motorized and nonmotorized recreational trail use.

(B) COMPLIANCE.—The determination as to whether a project or grant meets the requirements of subparagraph (A) shall be made by the State Recreational Trail Advisory Board.

(6) RETURN OF MONEYS NOT EXPENDED.—Moneys paid to a State that are not expended or dedicated to a specific project within 2 years after receipt for the purposes stated in this subsection shall be returned to the Fund and shall thereafter be reallocated under the formula stated in subsection (c).

(e) COORDINATION OF ACTIVITIES.—

(1) COOPERATION BY FEDERAL AGENCIES.—Each agency of the United States Government that manages land on which a State proposes to construct or maintain a recreational trail pursuant to this Act is encouraged to cooperate with the State and the Secre-

tary in planning and carrying out the activities described in subsection (d). Nothing in this Act diminishes or in any way alters the land management responsibilities, plans, and policies established by such agencies pursuant to other applicable laws.

(2) COOPERATION BY PRIVATE PERSONS.—

(A) WRITTEN ASSURANCES.—As a condition to making available moneys for work on recreational trails that would affect privately owned land, a State shall obtain written assurances that the owner of the property will cooperate with the State and participate as necessary in the activities to be conducted.

(B) PUBLIC ACCESS.—Any use of a State's allocated moneys on private lands must be accompanied by an easement or other legally binding agreement that ensures public access to the recreational trail improvements funded by those moneys.

(f) DEFINITIONS.—For the purposes of this section—

(1) ELIGIBLE STATE.—The term "eligible State" means a State that meets the requirements stated in subsection (b).

(2) FUND.—The term "Fund" means the National Recreational Trails Fund established by section 9511 of the Internal Revenue Code of 1986.

(3) NONHIGHWAY RECREATIONAL FUEL.—The term "nonhighway recreational fuel" has the meaning stated in section 9503(c)(6)(C)(ii) of the Internal Revenue Code of 1986.

(4) SECRETARY.—The term "Secretary" means the Secretary of the Interior.

(5) RECREATIONAL TRAIL.—The term "recreational trail" means a thoroughfare or track across land or snow used for recreational purposes such as bicycling, cross-country skiing, day hiking, equestrian activities, jogging or similar fitness activities, trail biking, overnight and long-distance backpacking, snowmobiling, surface water and underwater activities, and vehicular travel by motorcycle, four-wheel drive or all-terrain off-road vehicles, without regard to whether it is a "National Recreation Trail" designated under section 4 of the National Trails System Act (16 U.S.C. 1243).

**SEC. 5. NATIONAL RECREATIONAL TRAILS ADVISORY COMMITTEE.**

(a) ESTABLISHMENT.—There is established the National Recreational Trails Advisory Committee.

(b) MEMBERS.—There shall be 9 members of the advisory committee, 8 appointed by the Secretary from nominations submitted by recreational trail user organizations, one each representing the following recreational trail uses:

(1) Hiking.

(2) Cross country skiing.

(3) Off-highway motorcycling.

(4) Snowmobiling.

(5) Horseback riding.

(6) All terrain vehicle riding.

(7) Bicycling.

(8) Four-wheel driving.

In addition, the Secretary or an appropriate government official designated by the Secretary shall be a member of the advisory committee.

(c) CHAIRMAN.—The chairman of the advisory committee shall be the government official referenced in subsection (b), who shall serve as a nonvoting member.

(d) TERMS.—Members of the advisory committee appointed by the Secretary shall be appointed for terms of 3 years; except that the members filling 4 of the 8 positions shall be initially appointed for terms of 2 years, with subsequent appointments to those positions extending for terms of 3 years.

(e) DUTIES.—The advisory committee shall meet at least twice annually to—

(1) review utilization of moneys allocated to States under this Act;

(2) establish and review criteria for trail-side and trail-head facilities that qualify for funding under this Act; and

(3) make recommendations to the Secretary for changes in Federal policy to advance the purposes of this Act.

(f) ANNUAL REPORT.—The advisory committee shall present to the Secretary an annual report on its activities.

(g) REIMBURSEMENT FOR EXPENSES.—Members of the advisory committee appointed by the Secretary shall serve without pay, but, to the extend funds are available pursuant to section 4(c)(1)(C), shall be entitled to reimbursement for travel, subsistence, and other necessary expenses incurred in the performance of their duties.

○

1988

## NATIONAL RECREATIONAL TRAILS FUND ACT

Legislation has been introduced in both chambers of the United States Congress to create a National Recreational Trails Fund: S. 400 in the Senate, introduced by Senator Steve Symms (R-ID) and H.R. 1155 in the House of Representatives, introduced by Congressman Thomas Petri (R-WI). Both measures have attracted growing bipartisan support. Hearings on the proposals are anticipated soon, perhaps in conjunctions with efforts to reauthorize the nation's federal-aid programs for public roads. To clarify the purposes of the legislation, the bill sponsors and the Trails Task Force of the American Recreation Coalition have developed this "question and answer" information piece.

1. Question: Where will the monies for the new trails fund originate?

   *Answer: Monies will be transferred to the trails fund from the Highway Trust Fund. The amount transferred would be that portion of the federal motorfuel excise tax deposited into the fund which is attributable to off-road motorized recreation and back country camping. This amount is set at .5% (one half of one percent) initially, which would amount to an estimated $75,000,000 annually. The Secretary of the Treasury is authorized to adjust this percentage every three years, based upon estimates of actual use.*

2. Question: Have any trust funds similar to the proposed trails fund already been established?

   *Answer: Yes. the trails trust fund is similar in philosophy to the Aquatic Resources Trust Fund, commonly known as the Wallop-Breaux Fund, which aids boating access and safety, enhances the nation's fisheries and restores coastal wetlands. The Wallop-Breaux Fund receives annually 1.08% of all federal motorfuel taxes -- the portion attributable to recreational boating activities -- as well as some $50 million attributable to fuel consumed in lawnmowers, snowblowers, chainsaws and similar products.*

3. Question: How do you estimate fuel used in off-road motorized recreation?

   *Answer: The numbers of snowmobiles, off-road motorcycles and other vehicles is known through state registration programs and manufacturer shipments, and the use cycles of those vehicles has been studied by a dozen states and federal agencies including the Environmental Protection Agency. In fact, many states already transfer state motorfuel taxes on these vehicles to state trails funds. It is envisioned that a national survey to determine fuel usage in off-road recreation vehicles and back country camping would be conducted within three years of passage of this act.*

4. Question: Who will be eligible to receive these funds?

   *Answer: The funds will be distributed to eligible states.*

5. Question: What must a state do to be eligible for funds?

   *Answer: Initially, eligibility is automatic. After 3 years, states must have taken two steps to maintain eligibility. The first is to establish a State Recreational Trails Advisory Board on which both motorized and non-motorized recreational trail users are represented. The second is to reserve state fuel taxes collected on off-highway recreation fuels for trail construction and maintenance. Obviously, the state must also commit to using the federal funds for the purposes set forth in the act.*

6. Question: How will the available funds be allocated among states?

*Answer: First, up to 3% of the monies will be available to offset the costs to the Department of the Interior for administering the program. 50% of the remaining amount will be allocated equally among all eligible states. The remaining funds will be allocated among eligible states in proportion to the amount of off-highway recreation fuels used in each state.*

7. Question: Who will administer the state trail program?

*Answer: This will probably vary from state to state; the decision on assigning responsibility rests with each governor.*

8. Question: Who will determine a state's eligibility?

*Answer: The Secretary of the Interior, who will consult with the newly-created national Recreational Trails Advisory Committee.*

9. Question: What types of projects would be eligible for funding?

*Answer: Grant monies could be used for:*

- *construction and maintenance of trails;*
- *acquisition of easements;*
- *acquisition of property from a willing seller when the objective of a trail cannot be accomplished by other means;*
- *development of trail-side facilities approved by the new National Recreational Trails Advisory Committee;*
- *operation of state environmental protection and safety education programs relating to use of recreational trails (limited to no more than 5% of each state's allocation);*
- *expenses incurred by the state to administer the program (limited to not more than 7% of each state's allocation).*

10. Question: Will the fund aid all trail interests -- motorized and non-motorized?

*Answer: Absolutely. Motorized and non-motorized recreation must each receive the benefit of at least 30 percent of a state's allocated monies. Also, not less than 40 percent of a state's allocation must be spent in a manner which gives preference to project proposals which provide for the greatest number of recreational purposes and which provide for innovative trail corridor sharing to accommodate both motorized and non-motorized users.*

11. Question: Must all trails funded under this program be open to some or all motorized trail activities?

*Answer: No. The act seeks to create more and better trails for all uses and recognizes that mixing some trail uses can be unsafe and reduce the quality of the experience.*

12. Question: What trail uses are incompatible?

*Answer: That determination will rest with the state. However, the act does encourage states to experiment with different management practices which will assure that trails serve the greatest number of trail users as practical, including innovative trail corridor sharing programs.*

13. Question: Will funds from this program be available for trails on federal lands? State lands? Private lands?

*Answer: Yes to all of the above. Use of funds on private lands will require that the state has written assurances that the private landowner will permit use for a reasonable period, considering the level of public funds invested.*

14. Question: Can these funds be used to purchase trail corridors?

*Answer: Yes, but the act would preclude use of grant money for condemnation; willing seller transactions only would be permitted. However, such funds could be used to construct and maintain a trail on a corridor acquired through condemnation using other funding.*

15. Question: Does this act in any way alter the land use planning processes established under the National Forest Management Act, the Federal Land Planning and Management Act or change in any way the normal assessment requirements under the National Environmental Policy Act?

*Answer: Absolutely not. Rather, to the extent that any funds under this act will be spent on federal lands, it will typically be to implement trail needs identified in the land use planning processes of the federal agencies. Nothing in this act would overrule or force changes in federal land management plans.*

16. Question: Would this money divert money that would otherwise be spent on highways?

*Answer: The Highway Trust Fund currently takes in more money each year than Congress appropriates for federal-aid to highways. At the end of fiscal year 1991, the highway account of the trust fund will contain an unobligated balance of about $9 billion. This cannot be spent due to Federal obligation limitations. Thus, while the act would remove money from the Highway Trust Fund, it is unlikely to decrease the amount of money provided to the states for highways in the foreseeable future. Moreover, the excise tax on fuel imposed in 1956 to fund the Highway Trust Fund was created as a user fee, to be paid by those using the highways. Refunds for non-highway uses were provided, although individual refunds have recently been curtailed. There is no "user fee" justification for spending fuel taxes paid by off-highway recreationists for highway improvement or use.*

# 1992

Good Morning, Mr. Chairman, and other distinguished members of the Committee. My name is Lilla Richards. I am a member of the Fairfax County Board of Supervisors, and since June of 1989 have been Chairman of the National Capital Region Transportation Planning Board (TPB). The TPB is the Metropolitan Planning Organization for the Washington area, officially designated under federal highway and transit statutes to perform transportation planning and program management for the region. The membership of the MPO includes representatives from the area's 18 cities and counties including the District of Columbia, the state legislatures of Virginia and Maryland, the state transportation agencies, the Metropolitan Washington Airports Authority, the Washington Metropolitan Area Transit Authority, and five federal agencies. I appreciate the opportunity to appear before you today on behalf of the National Association of Regional Councils, the national organization that represents substate, multi-jurisdictional MPOs, such as mine, across the country.

I would like to begin, Mr. Chairman, by thanking you and the Subcommittee for moving so expeditiously toward reauthorization of the Surface Transportation Act which expires this year. We also commend you for your efforts in seeking a broad range of views and perspectives on the future federal program.

As we enter the post-Interstate era, we hope Congress will enact a bill that reflects a bold new vision for surface transportation systems and a renewed federal commitment to the federal, state and local partnership in meeting transportation needs. The kind of vision, and the commitment that is made, will largely determine whether or not we must continue to live with increasing congestion, further environmental degradation, growing energy dependence, and declining mobility for all Americans. This is a once-in-a-generation opportunity to fashion a program that will assure continued economic vitality and global competitiveness through enhanced productivity, promote greater energy efficiency, assist in the achievement of national environmental goals, and foster an enhanced quality of life for metropolitan and rural communities alike.

I know that you and the members of your subcommittee share these goals for the surface transportation program. And the Administration shares these goals as outlined in last year's National Transportation Policy. However, as NARC indicated in testimony before you last year, we part company with the Administration on the approach to best achieve these goals.

We hold firm to the views we expressed last year. These views are shared by five other national interest groups that co-authored the statement of principles for reauthorization entitled, "Tying It All Together". The general concepts we recommend also are similar to those espoused by the Surface Transportation Policy Project, a broad coalition of groups with transportation-related interests. Finally, we believe last year's enactment of the Clean Air Act Amendments provides additional, and compelling, reasons for you to consider the approach we suggest.

Resources

Any discussion of the future surface transportation program ultimately focuses on financial resources. We fully subscribe to the recommendations made, just three years ago, by the bipartisan Nation Council on Public Works Improvement. They concluded that the transportation sector is in need of a substantial resource infusion and called for a doubling of the investment in our infrastructure. The Council also called for a restoration of the federal government's financial participation to past levels.

Over the past decade, the federal contribution to highways and transit has steadily declined. State and local governments have been taking up the slack. We believe the federal government should not continue this shift of the transportation financial burden. We applaud the leadership of the House Public Works Committee in taking a strong stand before the Budget Committee on the need for a renewed federal financial commitment to transportation, and for your proposal to increase the motor fuels tax for transportation purposes.

Program Structure and Intergovernmental Planning and Program Management

Turning from the resource issue to program structure and the intergovernmental process, I would like to review our recommendations for the federal highway and transit program, and highlight some of our major concerns with the Administration's proposal.

First, we believe the program structure and process should be governed by the following objectives:

- Preservation of the Interstate Highway System;
- Greater flexibility to respond to unique needs and conditions and discretion to meet specifically defined federal policies and priorities;
- The use of systems management techniques as a condition for highway and transit project approvals;
- A broadened definition of transit to include all forms of high occupancy vehicle use; and
- An equitable distribution of resources to the states and metropolitan areas based on federally established formulas;
- A strengthened planning, programming and prioritization role for MPOs to ensure integrated transportation systems, to coordinate land use and transportation investment decisions, and to organize effective programs for attaining air quality and energy goals, and other national objectives.

Mr. Chairman, we share the growing alarm over ever increasing metropolitan congestion and rural isolation. We, as others, believe that the primary reason for the federal involvement in surface transportation is to enhance mobility and economic development, with sensitivity to and promotion of, other national goals such as air quality and energy conservation. We feel

that these purposes can best be served by refocusing federal resources to serve four basic objectives:

Interstate highway preservation, with emphasis on improved interstate and interregional travel performance;

Metropolitan mobility focused on development objectives and congestion relief;

Rural access and interregional travel needs; and,

Bridge rehabilitation and repair.

A redirected federal program structure must be coupled with a strengthened intergovernmental planning and program management process. We seek a process that would not diminish the role of the states, but rather one that would provide a stronger voice for local governments through a joint, collaborative process. Under our approach, local governments, in collaboration with the states, transit operators and the private sector, would jointly decide investment strategies based on the most effective solutions.

Let me focus more specifically on metropolitan mobility. We are in agreement with the Administration's National Transportation Policy that the future program must address ever increasing metropolitan congestion. We differ over how to achieve this objective.

We are concerned that the Administration's legislative proposal would focus the lion's share of resources -- 70% -- on a pre-defined set of highway facilities, which would not necessarily result in the most effective mix of investments to achieve enhanced mobility and other national goals. This, coupled with limited transferability and flexibility, would result in continued reliance on expanding the capacity of a limited set of highway facilities as the primary solution to congestion.

We also believe the non-uniform matching requirements proposed by the Administration would exacerbate the current bias toward expanding the capacity of

our Interstate system as the preferred strategy for dealing with congestion. Even in the Washington area, we have found that the most effective strategies for improving the performance of the Interstate are often investments off the system. By wisely investing in integrated strategies for overall mobility rather than an exclusive focus on a few highway facilities, we can help to ensure that the Interstate system can perform once again as it was intended, with high levels of service.

In the 96 metropolitan areas that are in violation of air quality standards, the Clean Air Act Amendments just enacted by Congress may require a change in transportation investment strategies. In serious and severe non-attainment areas, including this area, highway capacity expansion will be restricted. We are concerned that with the limited flexibility and highway bias in the Administration's proposal, non-attaining metropolitan areas would have difficulty finding eligible projects for federal transportation funding. This would erode the ability of non-attainment areas to make investments in transportation control measures that would assist in achieving air quality standards and in enhancing mobility as well.

Mr. Chairman, congestion is a national problem that cannot be solved solely by widening the Interstates, by upgrading principal arterials to Interstate standards, or by building bypasses. We believe that to deal with congestion we need a metropolitan transportation program that will focus resources on an integrated metropolitan transportation system. And we need to have flexibility and incentives to employ a combination of highway strategies, transit options, HOV lanes, and more effective systems management techniques. Moreover, we need allocation formulas that do not penalize areas that take actions to reduce Vehicle Miles Traveled (VMT).

The metropolitan systems program we propose is designed to assure that resources are directed to metropolitan areas for use on designated metropolitan systems and corridors. An enhanced performance-based planning and programming process would assure that resources are most effectively invested to meet national mobility objectives as well as other national goals such as air quality.

Thank you, Mr. Chairman, and members of the Committee. I appreciate the opportunity to testify before you today, and will be happy to answer any questions you may have.

1998

Testimony
of
The Honorable Peggy Rubach
Mayor of Mesa, Arizona
Chair, The United States Conference of Mayors Committee on
Transportation and Communications

on behalf of
The United States Conference of Mayors

before the
House Subcommittee on Surface Transportation
Thursday, April 18, 1991

I appreciate this opportunity to discuss the surface transportation reauthorization bill. I am the Mayor of Mesa, Arizona, a city of almost 300,000 people in the Phoenix metropolitan area. I am Chairman of the Maricopa Association of Governments, the Regional Planning Agency for Maricopa County, and Chairman of our regional Public Transportation Authority. I also chair The U. S. Conference of Mayors Committee on Transportation and Communications. As representative of a large and growing "suburban" city in a large metropolitan area, representative of a regional planning team, and representative of both regional and national urban transportation groups, I am pleased to be able to share with you a perspective from cities on our transportation program needs for the future.

I believe that much has already been accomplished toward reaching a national consensus on the future direction of transportation policy in this country. The U. S. Conference of Mayors has been working with numerous transportation coalitions to develop recommendations for a long-range transportation strategy.

Our Transportation Alternatives Group recommendations, Transit Now, the American Public Transit Association's Transit 2000 Project, American Association of State Highway and Transportation Officials' Transportation 2020, Rebuild America Coalition, as well as a U. S. Conference of Mayors roundtable, and a great deal of other public input, helped to shape the National Transportation Policy presented by President Bush and Secretary Skinner. I see a consensus on several broad themes to carry us into the next century, a consensus that is articulated in the National Transportation Policy and in H.R. 1351.

There is a consensus on the tremendous need for investment in transportation -- to reduce congestion, improve mobility, maintain our roads and bridges. There is a strong commitment to maintaining our interstate highway system and continuing a separate capital program for our nation's bridges. There is also a consensus that we need flexibility to meet our transportation challenges. State and local governments need to be allowed as many financing tools as possible.

The United States Conference of Mayors' policies for future federal surface transportation programs are attached to this statement for the record. They outline a program that includes among other issues:

- preservation and maintenance of the interstate and the existing transit program;

- a separate and flexible urban/suburban program targeted to address the movement of people and goods in the nation's population centers;
- a separate and flexible rural program to address the mobility needs of small communities; and,
- a separate bridge program.

Federal grants need to be flexible enough to meet existing needs, rather than encouraging spending on lower priorities based on available funding. We strongly support flexibility between highway and mass transit grants to accomplish our transportation goals. We also give strong support to the proposal to spend down the highway trust fund balances on needed transportation programs. It is important that we use these funds to meet critical needs rather than leaving them to paper over the deficit. There is a consensus that we need innovation to meet transportation needs. We need new and different financing mechanisms, new partnerships with the private sector. We need to put new technologies into practice. We need to continue to research new solutions and safety measures.

The National Transportation Policy calls for a shrinking of the federal financial role in transportation. The Administration's proposal says that federal funds should be focused on systems of national significance, and the state and local and private share of funding should increase.

The number one resolution from The U. S. Conference of Mayors on national transportation policy is that the federal commitment in this partnership should not diminish. State and local and private funding responsibilities are already increasing to meet the growing demand. State and local governments cannot bear the additional burden resulting from a reduction in federal funding. Regional transportation is an issue of national significance. We can't function as a nation without regional mobility. We need the federal government as a partner, with funding, to meet these challenges.

The Conference of Mayors also resolved that all increases in the federal gas tax should be targeted for transportation. The gas tax is a type of user fee. It should not be treated as a general fund revenue source, but as a targeted fee, collected to reimburse our treasuries for depreciation of our infrastructure and to pay for providing the capacity to meet transportation demand.

The U. S. Conference of Mayors policy states that "current funding formulae are improperly weighted against metropolitan areas." We are calling for a change so that funding is not allocated on the basis of lane miles, but rather on passenger miles travelled. This change will help to target funds to where the mobility need is greatest.

The President proposes to allocate highway trust fund monies based on gasoline consumption. This allocation contradicts our national goals for energy conservation and improved air quality. This allocation proposal establishes reverse incentives and penalizes jurisdictions that succeed in reducing gasoline consumption. In fact, some jurisdictions, like Maricopa County, must work toward reduced energy consumption to meet federal air quality mandates. It is certainly not fair to punish these jurisdictions with fewer highway dollars. We would like to work with you to develop a fairer, more productive allocation formula.

We support the administration's call for flexibility between highway and mass transit funding. The proposal may not be flexible enough, however. Only 15% of the funding for the national highway system is designated as flexible. For areas with established highways and extensive transit needs, this may not provide enough flexibility to provide the needed transit system. All funding for the urban/rural system is flexible between highways and transit, but the proposed structure sets up an undesirable competition between urban and rural areas. Both of these areas have very different, very real needs. We are concerned that this structure may not effectively meet existing needs in <u>either</u> area for the more than 500,000 highway miles outside the national highway system.

The administration's proposal to reduce the mass transit program

to only one dedicated penny of the gas tax after 1996 will decimate the federal mass transit program. Our mass transit program must be strengthened to carry us into the future. Not only are we striving to improve our mobility, we are also working to comply with federal clean air requirements and with the transit accessibility requirements of the Americans with Disabilities Act. State and local governments are already bearing a large portion of this added responsibility. We simply cannot accomplish these laudable goals if the federal financial role shrinks.

We need funding for projects to successfully link new transit programs with clean air and accessibility goals. The Phoenix metropolitan area has a special need here. As you know, we are operating under a federal implementation plan to reach our clean air goals. We are working hard to ensure that our transportation projects help us to achieve cleaner air, rather than detracting from our clean air efforts. As Chairman of both the Maricopa Association of Governments, our regional planning agency, and the Regional Public Transportation Authority, I need your assistance in making these linkages work. Our success can serve as a model for cities around the country. We are charting new ground here. We need your financial and technical assistance in our pioneering efforts.

Our priority as cities is to ensure that transportation funding

45-155 O—91——64

is available and can be used where it is needed most. But cities are not simply asking for hand-outs. We recognize that, as partners, cities have responsibilities to meet. We have resolved to work with the federal government to foster creative and attractive ways to encourage more private sector investment in transportation. We recognize that we have a responsibility to set priorities and make transportation choices. We have asked that any increase in local funding responsibility be accompanied by an increased local role in decision-making.

Unfortunately, the administration's proposal relegates local decision-makers to the planning table, giving us no role at all at the funding table where final decisions are made. We are responsible for contributing funding and implementing this nation's transportation programs; we must be involved in setting the funding priorities.

We recognize that we have a responsibility to work more closely together on a regional level. We are committed to developing stronger partnerships within our metropolitan areas, since transportation corridors seldom end at jurisdictional boundaries. We will work to coordinate and plan, and to share resources and ideas. By functioning as a team, we can make the road a little bit smoother for all of us.

We sincerely appreciate the President's efforts to develop a

broad public consensus, including input from local government. We appreciate your interest in understanding the transportation needs of cities. It is important that cities continue to be included in the decision-making process, both leading up to legislation and afterwards. We look forward to a strengthened national/local partnership as we move into the twenty-first century.

2006

# SURFACE TRANSPORTATION POLICY

# R E S O L U T I O N S

Adopted by

**The United States Conference of Mayors**

U.S. Conference of Mayors 1620 Eye Street, NW Washington, DC 20006
(202)293-7330

# OFFICIAL POLICY RESOLUTIONS

***Adopted at the 58th Annual Conference of Mayors***

*Chicago, Illinois*
June 15-20, 1990

## NATIONAL TRANSPORTATION STRATEGY

**WHEREAS**, the United States Department of Transportation released it's National Transportation Plan (NTP) in 1990 as a strategy for development of new federal surface transportation programs; and

**WHEREAS**, local governments submitted testimony, participated in roundtables and presented statements in the development of the NTP; and

**WHEREAS**, there is total agreement on the overall goal of the NTP to improve mobility, reduce congestion and increase economic development and productivity in this country, but there is also disappointment regarding the lack of specificity for future federal funding; and

**WHEREAS**, local governments approach the creation of new surface transportation programs through the critical and essential three-way partnership of federal, state and local involvement to sustain and improve the condition of this country's highways, streets, roads, bridges, mass transit and rail,

**NOW, THEREFORE, BE IT RESOLVED** that the United States Conference of Mayors urges Congress to be guided in their future surface transportation program deliberations by considering our standing policy as adopted in 1989, entitled "The Post Interstate Era", and that they also consider the following with respect to the strategy outlined by the NTP:

- That the federal commitment in the three-way partnership increase and not diminish;
- That immediate increases in investment at the federal level can be realized by spending down the Highway Trust Fund balances without negative affect on all other general revenue supported transportation programs, and that the Trust Fund monies only be utilized for transportation purposes and not deficit reduction measures;
- That transportation/infrastructure be one of the category of unmet needs addressed by future allocations from any "peace dividend" funding;
- That the new federally-aided program structure seek greater reinvestment in this nation's surface transportation system and focus on significantly decreasing congestion in urban/suburban areas through a unified metropolitan program; that this be accomplished through a redirection of funding when the Interstate construction program is ended; and that this urban/suburban program focus and funding allow for multimodal flexibility in relieving congestion at the local level;
- That the objectives of the federally-aided programs also continue to ensure the preservation and maintenance of the Interstate Highway System, the greater mass transit investment, the reconstruction and rehabilitation of bridges, and increased rural access;
- That the increased transportation funding responsibility of local governments envisioned by the NTP should be accompanied by an increased local role in decision-making regarding federal surface transportation programs and funds;
- And, that local governments support, where appropriate, the NTP goal of increased private sector investment in all transportation systems, and seek to work with the federal government in fostering creative and attractive means to encourage this.

## BILLBOARD REFORM LEGISLATION

**WHEREAS**, more than 500 cities and counties have identified sign control as a serious problem requiring new regulations to control billboards; and

**WHEREAS**, local governments have enacted or seek to enact controls to protect and preserve the beauty, character, and economic and aesthetic value of land thus protecting the safety, welfare and public health of their citizens; and

**WHEREAS**, local governments were permitted authority to remove non-conforming billboards along federal highways through an amortization process prior to passage of a 1978 amendment to the 1965 Highway Beautification Act (HBA); and

**WHEREAS**, after 1978, the HBA required local governments to provide cash payments to billboard owners before removing non-conforming billboards along federal highways, and stated that the Federal government provide 75 percent of the cost of that compensation for removal; and

**WHEREAS**, no federal monies have been appropriated since 1982 to assist cities in cash payments for non-conforming billboard removal,

**NOW, THEREFORE, BE IT RESOLVED** that The United States Conference of Mayors urges Congress to enact legislation that would:

- restore to local governments the authority to remove billboards along federal highways through amortization;
- support the authority of local governments to require non-conforming signs along Federal highways to comply with size and height requirements without cash payments;
- allow local government to require the removal of billboards in inappropriate locations, especially in rural, and designated scenic, historic and residential areas;
- provide local government with the authority to determine the placement of any new billboards, and specifically provide local governments with the ability to prohibit construction of new billboards by local ordinance.

# OFFICIAL POLICY RESOLUTIONS

ADOPTED AT THE 57TH ANNUAL CONFERENCE OF MAYORS

CHARLESTON, SOUTH CAROLINA

JUNE 16 - 21, 1989

The United States Conference of Mayors
1620 Eye Street, NW.
Washington, DC 20006
(202) 293 - 7330

## THE POST INTERSTATE ERA OF SURFACE TRANSPORTATION

**WHEREAS**, the safe, efficient and environmentally sound transport of passengers and goods is of crucial importance to the future economic growth and development of urban America; and

**WHEREAS**, the completion of the Interstate Construction program in 1991 provides the nation with an excellent opportunity to examine the respective surface transportation responsibilities of federal, state and local government, as well as the private sector with respect to surface transportation; and

**WHEREAS**, The United States Conference of Mayors has long viewed the issue of surface transportation as one of mobility provided by roads, bridges, mass transit, bicycle paths and pedestrian ways,

**NOW, THEREFORE, BE IT RESOLVED** that the Congress and the Administration be guided in their deliberations over the structure of the post interstate era of the federally aided surface transportation system with generally the goal of enhancing mobilty for the national population, and specifically as follows:

Funding

- The revenues currently earmarked for the Gas Tax Trust Fund and any increases in such revenues, should continue to be solely allocated to surface transportation needs and not diverted for deficit reduction.

- Revenues generated by the gas tax should be expended at the level annually collected and the current surplus in the Gas Tax Trust Fund should be drawn down as expeditiously as possible.

- The Gas Tax Trust Fund should be removed from the Federal Unified Budget so that its user fee revenues are not used to disguise budget deficits on paper. Further, The United States Conference of Mayors opposes any turnback to the states of the federal gas tax.

- State and local governments must be permitted to implement innovative techniques to generate the local share for federally aided projects including administration costs, right-of-way donations or acquisitions, toll facilities or real estate impact fees.

- The fiscal impact of policies to promote alternative fuels on the federal gas tax trust fund should be revenue neutral.

Program Structure

Interstate and Primary Systems

- The Conference supports allocation of resources to state governments for implementation of responsibilities which are impractical to be performed by individual units of local government, such as maintenance of the interstate and primary systems. Current funding formulae, however, are improperly weighted against metropolitan areas. These formulae must be changed to recognize the vital needs on these systems that are found in urban America and amended accordingly. Formulae to states should not be based on lane miles but more importantly on passenger miles travelled, including transit passenger miles travelled. Also substate formulae should be crafted to match and foster programs designed to relieve congestion.

- Interstate and Principal Arterials must be maintained and funding for maintenance on these systems should be held harmless with respect to increased system development. The emphasis of increased lane mileage should be replaced with capacity management goals or increasing the number of passengers not vehicles travelled on all federally aided systems. Such increased management techniques include emphasis on car and van pools, HOV lanes, mass transit and flex time hours.

- Eligible products in the Interstate program for capacity expansion, the 4th R of the I4R, must include the examination of various options to assist the capacity on the Interstate, such as HOVs and transportation management systems. Interstate funding would be available for projects even if the alternative is not on the Interstate system so long as the proposed project would aid capacity movement on the Interstate system.

Interstate Transfer

- The Interstate transfer program was a program breakthrough in the federal system of surface transportation assistance in that it permitted localities to decide what mode of transportation, whether highway, mass transit or a combination thereof,

best addressed their congestion problems. The federal government must honor and fulfill its commitment made in prior years in this program and institutionalize this system of local option as more fully explained below.

Urban/Metropolitan System

- The lack of Federal emphasis and funding for urban America's roads and transit systems is inconsistent with the stated goal of a federal surface transportation program of alleviating congestion where found. It is the belief of The United States Conference of Mayors that improved mobility in urban America may only come about as a result of our maintaining our current infrastructure, enhancing capacity to increase passenger miles traveled and demand management techniques and permitting the application of flexible and innovative responses adapted to local needs. Such a program must include at a minimum:

  - dedication of interstate and primary funding in urbanized areas;

  - strengthening of the funding levels for the federal aid urban system and formulae mass transit grants and permitting the current fungibility of a certain portion of these funds;

  - creation of a strategic metropolitan grant program with additional new funding which may be used at the discretion of the metropolitan area to meet either transit, road or nonmechanized transportation needs;

  - the eligibility for projects under this additional program would be unrestricted for road projects and available for capital and operating mass transits projects.

Bridges

- The special nature of and vital role of bridges in the national surface transportation program warrants the existence of a separate category in federal aid system. All bridges, regardless of their characteristics as a roadway or railway bridge, must be made eligible for the off-system bridge program and preventive maintenance projects, must be included as eligible for funding.

Safety

- Safety must always be a top priority of a surface transportation program. Further, safety grants should be directed in substantial portion to urban areas as it is in urban areas that the greatest number of people would benefit from such grants.

Matching Funds

- The level of required state/local matching funds should not be the deciding factor in what project a state DOT chooses to proceed with. Therefore, The United States Conference of Mayors would support a level or consistent match grant ratio across all programs. An 85/15 match is not unacceptable.

Clean Air

- In all cases, federal transportation policy should be cognizant of the need to direct resources to clean air.

- The Federal Tax Code should be amended so as to equalize the transportation fringe benefits that an employer may provide an employee.

## URGING STUDY OF THE BUDGETARY AND ADMINISTRATIVE IMPACTS OF IMPROVED ENVIRONMENTAL REVIEW PROCEDURES

**WHEREAS**, a wide variety of public works projects beneficial to cities are often delayed, made more costly, and sometimes stopped by overlapping local, state and federal requirements for Environmental Impact Statements and Environmental Impact Reviews; and

**WHEREAS**, these overlapping, vague, and occasionally contradictory requirements often lead to duplicative administrative reviews, increased engineering costs, and significant amounts of time lost; and

**WHEREAS**, current administrative capabilities to coordinate the preparation of these reviews are not adequate to prevent significant procedural overlaps; and

**WHEREAS**, the manner in which these reviews are implemented by Federal agencies sometimes reduces the flexibility and discretion needed by local government to meet its infrastructure needs, even where these needs are being financed by local governments; and

**WHEREAS**, streamlining and reconciling these overlapping requirements and reviews, while providing as much discretion as possible to local governments could lead to significant savings of public funds and staff time, in permitting local governments to provide for their infrastructure, without reducing the protections mandated by the National Environmental Policy Act and other environmental protection goals,

**NOW, THEREFORE, BE IT RESOLVED** that The United States Conference of Mayors urges the President's Council on Environmental Quality to conduct a study of the relative costs and benefits of current overlapping environmental review procedures, as well as potential time and budget savings at the local level that could result from streamlined procedures and amendments to the National Environmental Policy Act. This study should be coordinated with the Departments of the Interior and Transportation, and the Environmental Protection Agency, and the U.S. Army Corps. of Engineers to assess potential national budgetary impacts and based on these findings, to promote streamlining of environmental impact regulations; and

**BE IT FURTHER RESOLVED** that The United States Conference of Mayors urges that with the increased financial burden on local governments to provide for their future infrastructure needs with limited or no federal funds, federal agencies should implement existing regulations, with unduly jeopardizing environmental goals, in such fashion as to decentralize discretion and decision-making wherever possible to the local, state, and regional levels where the cost and constituent burdens for overcoming infrastructure problems squarely rest.

STATEMENT OF ROBERT L. SUTHARD, SECOND VICE PRESIDENT, INTERNATIONAL ASSOCIATION OF CHIEFS OF POLICE

I am Robert L. SUTHARD, Second Vice President of the International Association of Chiefs of Police and Secretary of Public Safety for the State of Virginia. Formerly, I was the Superintendent of the Virginia State Police. On behalf of the State and Provincial Police Division (S&P) of the International Association of Chiefs of Police (IACP), I wish to thank you for providing us the opportunity to comment on the Reauthorization Program for federal highway, transit, motor carrier and highway safety programs. As chief executives and command level personnel of all the state and highway patrol agencies in the country, we are particularly interested in the highway safety portions of this proposal and the reauthorization process in general.

S & P, an IACP division which maintains a separate administrative identity and elects its own board of officers biannually, concentrates on the special needs of state and provincial law enforcement agencies. Sections within the division include a State Police Planning Officers Section, a State and Provincial Police Academy Directors Section and an Advisory Committee on Highway Safety. We provide continuous liaison to the U.S. Department of Transportation and the National Highway Traffic Safety Administration in all matters relating to and affecting the operation of state highway patrols and state police agencies.

At a recent Screening Committee meeting of our Advisory Committee on Highway Safety, we discussed a number of issues and areas contained in the reauthorization legislation. First of all, let me say that we in the highway safety end of the law enforcement profession get pretty anxious when we realize that all of the highway safety program monies- 402 for highway safety directly, 403 for research and demonstration funds and then on to the 408 & 410 monies for states that have innovative programs that can qualify for those funds- must be reauthorized or they will disappear. We understand that the deficit demands strict budgeting and priority setting; however, we feel that our highway safety program is of such a priority that it must continue. Perhaps a core of programs can be identified that we consider the absolute minimum level of funding for each cycle and the other programs will be reauthorized each cycle.

We are generally pleased with several aspects of the program that are proposed for reauthorization: the many innovative speed enforcement DUI and safety belt programs that are ongoing are contained in the 402 funding area. Some of the 403 funding deals with drug recognition and the program of spreading this technology throughout the nation. A number of states have qualified for 408 and are striving to improve their highway safety records and

systems so that they can ultimately qualify for 410 monies. This concept of rewarding innovative programs, rather than sanctioning those who have failed, is one that was recommended at the Traffic Safety Summit in Chicago and was passed along to Secretary Skinner at that time. We are very happy to see it implemented in the reauthorization proposals.

We are especially pleased with the new safety bonus program that continues the statutory contents of the present alcohol traffic safety and drunk driving prevention incentive grant programs and expands upon the concept of rewarding state action for improving highway safety laws and programs. It is this kind of incentive that we feel will bring about the kind of highway safety program that is needed in this nation to save lives.

However, we have one concern with the bonus program: speed enforcement should not be de-emphasized, certainly not in the bonus program. Adequate speed enforcement should be recognized under this incentive program. Agencies can be measured through demonstration of their speed enforcement program by submitting a speed enforcement plan for evaluation. Such items as speed measuring devices (radar, vascar), aircraft used for speed enforcement, speed enforcement teams, unmarked police vehicles, and other items can be used for evaluation purposes. The role of speed enforcement in promoting safety on our highways can never be overemphasized. The issue is far too important to not have a priority role in an incentive program.

Another area of concern for us is funding for MCSAP. The Motor Carrier Safety Assistance Program has truly formed a partnership between the federal, state and local agencies in the carrying out of inspections, terminal audits and improving the overall safety records of motor carriers. This funding has been very instrumental in causing the seed to be planted that has grown and is now working. Contained in this area is the threat of bigger, longer, heavier trucks. It is the belief of our Highway Safety Committee, and of many others, that the safety of our highway system will not only be threatened, it will be eroded away if we allow the triples and the additional weight to appear on our highway system.

The arguments are traditional: between those that are involved in the economics of our transportation system and those that are involved in the safety of that system. Again, the lineup is the American Trucking Association or the owners and those that would benefit and profit from having heavier and longer trucks. They are lined up in opposition to all of the safety experts, the

unions that provide the operators for those vehicles and, in fact, the public who is in fear that these larger vehicles will jeopardize them as they operate their cars on the same highway system. All of the many arguments involving additional problems and inclement weather, the swaying and the whipping of the third trailer that will be magnified by the length and the number of the articulated joints, all of these are factors that are well known. It boils down to the simple economics of the issue versus safety on our highways. The IACP intends to play a strong part in opposing any passage of legislation at the federal level or in the states that would allow a further deterioration of our safety system by allowing triples on our highways.

In conjunction with this position, we are somewhat taken aback by the administration proposal to completely preempt state regulatory authority over trucks. Section 508 calls for the elimination of state regulatory authority over routes, rates and services. Without this oversight, trucks would be able to use any route they choose without regard to safety or engineering factors. We feel this proposal should be given the utmost scrutiny before implementation.

Another area of concern is the manner in which the national maximum speed limit might be handled. There's been a proliferation of proposals that would do everything from going back to 55, the way it was, to doing away with the national maximum speed limit altogether and giving the issue back to the states. It has been a long-standing position of the IACP that the national maximum speed limit, as it now exists, 65 on rural interstate, 55 in other areas, be maintained, but that it be maintained in such a way that there be no sanctions for the enforcement of same. Once again, those jurisdictions who do a good job in having a well-rounded all encompassing highway safety program should be rewarded for that. Those jurisdictions who do not do so well in one element alone of that highway safety program, should not be chastised for that one individual failure. This has become very apparent in some of the states who have failed to meet the compliance levels of the federal maximum speed limit, but whose fatality records are at an all-time low. This is a contradiction that we cannot overlook, but when you have made a success in a highway safety program we certainly don't need to sanction for that success.

Funding levels in the proposal are a different concern, and , of course, must be viewed in terms of the budget woes that face us all, in the federal government, state government, business, associations like IACP, and the like. We are, however, concerned with areas in the budget where we see "short funding" and "stagnant funding." For example, the administration's proposal

for the Section 402 State and Community Highway Safety grant program includes an 8.7% decrease in the authorization level and a reduction in the federal share from 75% to 60%. Funding for impaired driving programs is proposed at $25 million per year -- only $5 million above current levels and $25 million less than authorization levels. The Administration is proposing to lower the federal matching share for impaired driving incentives from 75% to 60%. [In 1989, half of all traffic fatalities were alcohol-related.]

We see the issue as growth in the programs. Growth is in the Title 23 program. We think it should also be in the other programs: alcohol safety, 402, etc. The section 402 program has not been funded at authorized levels in the last seven years, so we feel it unlikely that it would be funded at the level proposed. We do not want to see a retrenchment in federal support for this basic highway safety program. The entire law enforcement community supports this program and the program works well.

The highway safety grant programs do not grow over the authorization period, even though all of the highway construction programs are projected to grow by substantial amounts. In total, the federal highway program is projected to increase by nearly $7 billion between FY 91-96. By contrast, the federal non-construction highway safety programs are only slated to receive an increase of $225 million during that time. If safety is indeed the top priority, then the funding proposal must mirror that priority.

We do not see a reason to lower the federal matching share of the 402 program to 60% The 402 program is a seed money program. By the end of the third year, all federal funding is eliminated from these projects and they must be supported solely by state and local funds. Unlike construction programs, the 402 program does not encourage state and local dependency on federal funds; it leverages state and local funding. We see no reason to lower the federal share.

Under the Administration proposal, there would be nor earmarking for speed enforcement of 55 mph roads and no earmarking for school bus safety programs. In previous authorizations, $20 million had been earmarked for speed enforcement. Under this proposal, those funds are gone. We feel that the funds definitely should be retained and should be earmarked for enforcement purposes. In this way, the various enforcement programs would not have to compete with other programs for funds.

We would like to encourage increased funding for the alcohol programs. Given the scope of the problem of accidents caused by driving while under the influence of alcohol, we think it imperative that we continue to target this behavior. The Administration proposal, instead of increasing the flexibility of this program, would maintain it as is. We think that, if incentives were made, more states would be motivated to pass impaired driving laws and would, thus, qualify for incentive grant funds. Currently, only half of the states qualify for the Section 408 Alcohol Traffic Safety grant funds, and no states qualify for the Section 410 Drunk Driving Prevention grant funds. We think that an expansion of the program would definitely yield tangible results.

In summary, we wish to encourage the Subcommittee to look toward long range planning in the area of funding for highway safety. In this time of fiscal restraint, we are aware of the need for economic austerity, but within those parameters, decisions are made on the basis of priority. We feel that the safety of the public on the highways of American has to be one of our highest priorities. We hope to see that priority reflected in this reauthorization process.

Once again, we would like to thank the Subcommittee for allowing us to comment on current funding proposals and the program in general. I would be happy to answer any questions at this time.

Thank you.

2021

STATEMENT OF

SENATOR CHARLES L. WADDELL

705G East Market Street

Leesburg, Virginia 22075

703/771-2540

on behalf of the

NATIONAL CONFERENCE OF STATE LEGISLATURES

before the

SUBCOMMITTEE ON SURFACE TRANSPORTATION

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

U.S. HOUSE OF REPRESENTATIVES

on

*Reauthorization of the Federal-aid Highway and Mass Transit Programs*

April 18, 1991

2167 Rayburn Building

U.S. House of Representatives

Washington, D.C.

Mr. Chairman, members of the Subcommittee, I wish to thank you for providing this opportunity to hear the views of the nation's state legislatures. I am State Senator Charles Waddell and I come before you representing the National Conference of State Legislatures and also as a member of the Virginia General Assembly.

This Subcommittee's work to reauthorize the federal-aid highway and mass transit programs is of critical interest to the Commonwealth of Virginia, as it is to all states. The state-federal partnership which has successfully managed the creation, construction, and soon-to-be completion of a national Interstate system, provides a foundation for the next era in the federal-aid programs.

However, this foundation has developed some structurally unsound "pilings," with the result being a lack of state confidence in federal support. In the budget Congress approved last year, the long-standing commitment to dedicate highway user fees to highways was breached; the promise to devote aviation ticket taxes to aviation programs was reneged on; and now there are proposals surfacing to impose yet another federal fuel tax increase without remedying existing diversions and withholdings of transportation revenue.

Increasingly, states have no choice but to rely heavily on their own resources. Over half the state legislatures have considered, or will consider, motor fuel tax increases this year alone. There are presently only nine states with fuel taxes lower than the federal tax. And of these nine, only two have not increased their tax rate in the last decade. Virginia increased its motor fuel tax to 17.7 cents in 1987.

The five-cent federal tax increase which went into place December 1, 1990, has effectively eroded state revenue collections from state-imposed motor fuel tax. While this erosion is a prospective one, reducing funds that would otherwise accrue to state coffers has the same practical effect as reducing existing receipts.

The fact that only half of last year's federal motor fuel tax increase is dedicated to transportation programs is unacceptable to states with critical transportation needs. I suggest that if we are to truly have a state-federal partnership in meeting transportation needs, this diversion of transportation taxes must end.

PROGRAMS

Highways

NCSL supports streamlining and consolidating many of the existing highway funding categories. Organizing categories of spending by similar function or service orientation would provide states the opportunity to invest in each portion of the system in a rational manner. The existing categorical federal-aid highway program has actually removed states from the planning and decisionmaking process. The states are simply notified of their apportionment in each category and must appropriate matching funds if they are to access federal dollars.

As such, state transportation plans are driven by the availability of categorical funds, not by individual state needs. By consolidating categories and eliminary unnecessary regulation, states would be encouraged to develop comprehensive state plans which respond to priority needs.

However, consolidation should not be used as a cover for reductions in federal funding levels.

NCSL supports the creation of a national highway system in the post-Interstate era. Such a system should build upon the existing system with the focus being on upgrading major arterials which impede a fully interconnected network. Special attention should be given to the problems of rural access and urban congestion. These are not parochial concerns. Our national network is only as good as it weakest link.

Hopefully, inherent in a more flexible program will be a collaborative process involving local participation. The current rigid categorical funding methods have provided an incentive for seeking out separate Congressional funding for specific projects. In many instances, this has the effect of limiting financing available for other formula-based projects designated as state priorities.

Highway Safety

NCSL supports the elimination of all federal sanctions used to enforce federal safety standards, particularly in operator-specific areas. The federal highway safety program should be one which fosters comprehensive safety programs at the state level through the use of incentive grants. In your review of current and proposed highway safety programs, please examine these programs with an eye toward making them more results oriented and less rigidly programmatic. Incentive grants do work, if the compliance criteria are realistically devised.

In the context of highway program reauthorization, federal efforts should focus on developing and financing technology that promotes highway safety, and in providing leadership in public safety education campaigns.

States prerogatives to enact and enforce laws to ensure the safety of the motoring public must not be contravened. This is of critical concern in the area of state motor carrier regulations. While I can appreciate the concerns of the motor carrier industry to avoid unnecessary regulation in order to be competitive, the states' sovereignty must be protected. I would encourage this Subcommittee to forego addressing complex motor carrier regulatory issues as a part of this reauthorization package.

Mass Transit

The transit industry claims that $15 billion is needed in each of the next five years to address capital investment needs. States are making every effort to support increasing transit demands. In 1988, state operating assistance represented the third largest aggregate source of transit income. The Commonwealth of Virginia has contributed approximately $350 million to meet transit needs, excluding the state contribution to METRO.

In most states, state and local grants provide the non-federal share of capital funding. However, according to a paper presented at a 1988 AASHTO meeting held in Fredericksburg, Virginia, "the dichotomy in the relative importance of federal capital and operating assistance to different size transit systems makes it difficult for states that have both large and small transit systems to reach a consensus on its optimal state transit funding role."

I believe this bit of insight shared by John Dockendorf of the Pennsylvania Department of Transportation provides critical guidance to any federal restructuring of transit assistance in the reauthorization package.

The capital and operating needs of small and large transit systems vary greatly. I urge you to undertake the necessary finetuning to make current programs more responsive to exhibited need. NCSL continues to support the General Fund financing of the mass transit programs. Until such time as a more stable source of funding is identified, Congressional intent to supplement General Fund support, through dedicated motor fuel taxes, should be maintained.

FINANCING

We are pleased to see that Congress authorized a higher obligation ceiling for FY 1991 federal-aid highway programs - $14.5. This represents a 19 percent increase over the FY 1990 obligation ceiling. I applaud the members of the Public Works and Transportation Committee for seeking an even higher obligation ceiling in the FY 1992 budget. However, preliminary reports seem to indicate that a $1 billion increase might be the best we can hope for, and I for one, hope not.

While NCSL's position has been to support the highest funding level which could possibly be supported by transportation user fees, we have not settled on any arbitrary figure. We do, however, assume that all transportation taxes and fees should be made available for transportation expenditures. With only an incremental increase such as that surfacing in Budget Committee discussions, the Trust Fund balances will continue to build and the infrastructure will continue to erode.

Any restructuring of the federal financing scheme should ensure that state and federal investment goals are compatible, particularly those related to growth management and economic development. Any restructuring of federal-aid formulas should reflect the extent and usage of the system.

At the end of 1991, approximately $11 billion in state apportionment will remain unused due to the obligation ceilings imposed by Congress. States must be allowed to access all apportioned funds and this can only be accomplished by the removal of arbitrary spending restraints such as obligation ceilings and the removal of self-supporting transportation programs from the limitation of the domestic discretionary spending cap.

I would like to comment on proposals to reduce the federal match for many of the existing categories. NCSL supports a rationalizing of the federal match with the federal share proportionately higher for those programs deemed to be in the national interest. However, this rationalization has inherent problems. In general, proposals to reduce the federal match seek to leverage maximum state and local dollars. State and local contributions to the national highway system already represent more than 3/4 of all highway spending.

Any reduction in the federal match demands concomitant reductions in bureaucratic red tape and increased flexibility in planning and programming. Furthermore, there need be an adequate transition period during which states experience no loss in overall federal funds. Over half the states are having budget difficulties and are not in a position to generate additional funds for transportation projects.

A brief look at some of the states' fiscal pictures shows California with a potential budget deficit over the next 18 months approaching $12.6 billion; Illinois having been placed on a Standard and Poor's credit watch; and Rhode Island, just this week, terminating the furlough of state employees. For those few states not experiencing revenue shortfalls, austerity budgeting is the standard. Clearly states are not in any position to cough up more money for transportation programs.

I would like to include for the record an NCSL "State Budget Update," which provides a state specific look at state efforts to address budget shortfalls.

While the federal government can count on approximately $1 billion in revenue to be generated from every penny increase, there is a great deal of variance at the state level. For example, in Virginia we estimate each penny generates $34.9 million, whereas California gets $130 million for each penny increase. The State of New Jersey can generate about the same revenue as Virginia, but does so with a tax (10.5 cents)that is less than two-third's the level of Virginia's (17.7 cents.) To further highlight this variance, a look at Nebraska's motor fuel tax shows the highest tax in the nation at 26.4 cents. Yet the state only generates $7.7 million per penny to raise one quarter of the revenue Virginia collected in the same year (Fiscal year 1990.)

In short the financing decisions made by Congress to increase or divert federal fuel taxes have a disparate impact on state efforts to recoup these losses. In 1986, the Commonwealth of Virginia adopted a $10 billion, 12-year transportation program to be supported through the creation of a multi-modal Transportation Trust Fund. This long-range plan, however, was predicated on a continuous, predictable federal contribution. Virginia needs at least $400 million per year in federal assistance for the existing Interstate system.

Our population has grown some 14 percent in the past decade, but travel has increased during the same period by 50 percent.

PREEMPTION

Although the federal contribution to the nation's transportation system has been steadily declining, there has been no reduction in federal "strings." If anything, trust fund dollars have become a tool for compelling state compliance in other social policy goals that cannot be constitutionally mandated by Congress.

At this time, states operate under threat of losing vital federal-aid highway dollars if not in compliance with at least 15 mandates, some of which are tangentially related to the highway program. I strongly urge this Subcommittee to resist the temptation to dictate state legislative behavior through the use of sanctions. A much more palatable approach that was included in last years Transportation Appropriations legislation provides for a state to "opt out" of federally-mandated license revocation procedures.

This mechanism in no way weakens the Congressional intent to prevent drug abusers from driving on the nation's highways. What it does do, is allow each state to determine whether the specific federal requirements in this area complement ongoing state efforts to promote highway safety. What you may well find is a state rejecting the federal license revocation approach because the convicted drug abusers in that state are in jail and are not likely to have an opportunity to use their driver's license.

This exercise in democracy has a great deal of promise in fostering a cooperative state-federal relationship. I strongly encourage this Subcommittee to include the "opt out" provisions for those mandates which now employ the threat of highway funding losses, and certainly this is an approach which should be incorporated with any new federal mandates.

CONCLUSION

The national transportation network includes all modes. If the goal embodied in a national transportation network is to efficiently move people and goods in an integrated manner, we have an obligation to ensure that there are no weak links in the system. In restructuring the federal-aid highway and mass transit programs, clear national goals should be established which are supported by both the public and private sectors.

In general, the state are concerned that the completion of the Interstate system and the reauthorization of highway and mass transit programs be viewed as an opportunity to restructure the federal-aid programs in a more efficient and effective way. The following premises should underlie the reauthorization package:

-- Maximize expenditure of trust fund monies by increasing obligation ceilings and dedicating all user fees to appropriate trust funds.

-- Focus federal spending in areas of national significance as determined in collaboration with the states.

-- Ensure that states receive a fair return relative to their contributions to the trust funds.

-- Provide greater flexibility to states in planning and programming, both between and within funding categories.

-- Eliminate federal-aid highway funding sanctions.

-- Remove federal restrictions which limit states in their ability to develop innovative financing.

I am including for the record a copy of the NCSL transportation policies, which provide additional direction and recommendations on highway, highway safety and mass transit programs. I am also including Commonwealth Policy Goals developed by Virginia.

Again, I have appreciated the opportunity to share with you the views and concerns of the nation's legislatures. I look forward to working with you on the programs that will not only address mobility needs, but complement our national social, economic and environmental goals as well.

National Conference of State Legislatures

## OFFICIAL POLICY

### HIGHWAYS

The National Conference of State Legislatures supports the continuation and preservation of a federal-aid highway program. The federal government has a role in supporting a national highway system which meets national defense needs and facilitates interstate commerce. The federal program should direct spending to national priorities, while allowing for state flexibility in local and regional variations.

Finance

A. A federal trust fund, financed by user fees, should be retained as the primary method of funding federal-aid highway projects.

B. Any increase in existing user fees, in the absence of full trust fund expenditure, is unacceptable.

C. The Highway Trust Fund should be removed from the federal unified budget and the spending limitation imposed by Gramm-Rudman-Hollings requirements.

D. Annual appropriations should equal authorized spending levels. Obligation ceilings should be set to reflect actual receipts, plus interest earned.

E. The "user-fee" nature of the Federal-aid highway program must be safeguarded from any attempts to divert these fees to non-transportation spending.

F. Consideration should be given to changing federal laws which prohibit the use of "developer or impact" fees to finance new construction of federal-aid highways.

G. Federal guidelines should be designed to accommodate private sector support.

H. Existing federal taxation exemptions for gasohol should be eliminated.

I. The federal match should be rationalized to encourage state efforts in specific programs of national significance.

J. An examination should be undertaken on the advisability and feasibility of establishing a federal capital budgeting program.

Interstate System

A. The Interstate system should be completed, with consideration given to possible enhancements, including "outer bypasses," new Interstate connectors, and highways of national significance. Priority should be given to congested corridors if Interstate system is expanded.

444 North Capitol Street, N.W. • Suite 500 • Washington, D.C. 20001 • (202) 624-5400

B. Current provisions allowing some states to increase their obligation authority by lapsing Interstate completion money in exchange for Interstate discretionary money unfairly penalizes states which have completed their portion of the Interstate. Modifications to the program are necessary to preclude this "double-dipping."

C. The level of funding available for maintenance should insure that at a minimum, the current condition is maintained.

Primary/Secondary Roads

The Primary and Secondary roads have suffered from a lack of financial investment. In order to provide the necessary links to areas of the country otherwise unconnected, these roadways must be upgraded. Access to the Interstate system, particularly for commercial traffic, is presently impeded due to poorly maintained roads. The federal government should include those primary and secondary roads of national significance as part of the national system.

Bridge Program

Many of the nation's bridges are structurally deficient or functionally obsolete. A special bridge program should be created to provide immediate funding for deteriorated bridges. States should have the flexibility to invest federal funds in the most critical bridge needs. A variable inspection program would allow states to direct attention to the bridges which present the greatest hazard.

Tolls

The use of tolls for financing or supporting certain segments of highway is an acceptable alternative when funding for construction or maintenance would be otherwise unavailable. The present toll pilot project should be expended to provide for participation by other states with eligible projects.

Sanctions/Mandates

The use of federal-aid highway funds as a sanctioning device to enforce federal non-transportation goals is an anathema to states. Federal-aid highway funds should be disbursed or withheld based solely on a state's compliance with criteria applicable to the federal-aid highway program. Any criteria mandated by law must be adequately funded. Any reduction in the federal match portion for a specific program should be accompanied by a reduction in mandates for that program.

Allocations

Any modification to apportionment formulas necessitated by changes in transportation demands or patterns must include "hold harmless" provisions for those states which stand to have their apportionments reduced. All states should receive a minimum return of 90 percent on their contribution.

Demonstration Projects

Those projects which are otherwise ineligible for federal-aid monies and are not among states' designated priority projects are improperly competing with state-established priorities. These "demonstration projects" should be funded through a state's regular apportionment; should not be outside spending controls in place for formula projects; and should never place funding for state programs at risk.

Investment

Increases in the federal investment are necessary to maintain an adequate highway system. Investment efforts should focus on improving safety, reducing the cost of transportation, alleviating congestion, and preparing for the traffic demands of the future.

Grants

Extensive categorization of programs reduces the flexibility of states in addressing transportation needs and arbitrarily encourages expenditures according to the availability of federal funding. Where feasible, categories should be reduced and state flexibility increased. Existing barriers to transferability of funding should be eliminated.

Research

The federal government should continue to take a lead in highway research and planning. Research activities should focus on the utilization of innovative technology; elimination of transportation barriers; reduction of transportation costs; and promotion of economic development for all economic uses of the entire highway corridor and potential development caused by the highway existence.

Scenic Roads

A scenic road program is an important component of the federal-aid highway system. Incentives should be provided for efforts to maintain scenic and historic roadways. Changes need to be made in the Highway Beautification Program which facilitate the removal of illegal or non-conforming signs. Such changes should take into consideration the fiscal ability of the state or local removal/compensation authorities.

Urban System

The urban road system has become increasingly congested as traffic volume has exceeded road capacity. Those sections of Interstate in urban/suburban areas of the country which have experienced tremendous growth should receive special attention. A new category of funding should be created to provide support for capacity expansion.

Rural System

Greater emphasis should be placed on developing rural highways. Federal programs should focus on upgrading existing highways with a goal of encouraging economic development, commercial access, and personal mobility.

Set-asides

The recently expanded Disadvantaged Business Enterprise program includes women as a presumptive class of socially and economically disadvantaged individuals in a single goal system. NCSL supports the distinction of contract and overall goals for minority and for women-owned firms. The present lack of separate goals allows a disproportionate amount of set-asides to be awarded to firms, notwithstanding their economic standing.

National Conference of State Legislatures

## OFFICIAL POLICY

### MASS TRANSIT

The National Conference of State Legislatures recognizes the important role the federal government has played in recapitalizing deteriorating transit systems. The mass transit component of the national transportation system is vital to urban and rural dwellers, commuters, elderly, young and the poor. Adequate federal support of the mass transit system will contribute to the reduction of urban congestion and air pollution; encourage energy efficiency; and promote overall mobility.

Federal Programs

The focus of a federal mass transit assistance program should be on alleviating congestion and ensuring mobility. The existing programs should be restructured to provide federal support for those efforts which seek to encourage and expand ridership. The federal program should not encourage investment according to the availability of categorical funds, but on the basis of need and merit. The level of federal support should bear a relationship to the service levels state and local governments are willing to support.

A. Formula Grants - consideration should be given to a consolidation of categorical programs in order to increase state and local flexibility in priority-setting. However, a consolidation of mass transit and any highway grant program may result in undesirable competition for limited funds.

B. Discretionary Grants - this program should be supported with the one-cent federal gas tax in order to provide assistance to capital-intensive projects. NCSL opposes efforts to require minimum allocations of discretionary capital funds regardless of specific demonstrated need and in the absence of requirements that funds from the Mass Transit Account be dedicated to mass transit projects only. NCSL does not support preferential treatment being given to applicants who overmatch federal financial requirements. This policy would place less economically healthy applicants at a competitive disadvantage.

C. Research/Development - the federal government has an appropriate role in financing a viable research and development program. The financial commitment in this regard has decreased in recent years. Federal research should concentrate on the development of efficient and reliable modes of mass transit.

Finance

NCSL supports the present division of federal aid, with discretionary grants financed with the one-cent federal gasoline excise tax and formula grants supported through General Fund revenue.

444 North Capitol Street, N.W. • Suite 500 • Washington, D.C. 20001 • (202) 624-5400

45-155 O—91——65

A. Tax Policy - federal policies should be changed to support the use of high occupancy shared-ride services and to provide overall incentives for system usage.

B. State Efforts - any statutory or regulatory barriers to state and locally-granted revenues should be removed.

C. Private Sector - the private sector has an important role in supplementing public support. The level of private sector participation is best determined by state and local authorities. Mandated private participation criteria should not be a prerequisite for receiving federal funds.

Mandates

The number and scope of federal mandates to recipients of mass transit recipients has grown steadily. These mandates require recipients to meet certain transit and non-transit related social goals. In the absence of federal financial support for the implementation of such mandates, NCSL urges that mandates not directly related to the mass transit program be eliminated and those that are necessary to the program be fully funded.

As existing federal goals for mass transit providers are somewhat ambitious, there is room for clarification of purpose so that limited funds are disbursed in the most efficient manner. Federal mandates should not be applicable to state and local "overmatches."

National Conference of State Legislatures

## OFFICIAL POLICY

### TRANSPORTATION SAFETY

The National Conference of State Legislatures supports a continued federal role in setting national performance and safety goals. Highway safety programs should be expanded to incorporate emerging safety issues.

Federal transportation safety programs should provide incentive funding to promote comprehensive safety programs in the states. Necessary modifications should be made in federal safety grants programs to permit the maximum number of states to qualify, with the level of annual appropriations being adequate to fund grants to all states which qualify.

NCSL opposes the use of federal sanctions to enforce federal safety standards, particularly in operator-specific areas, such as speed limit compliance. Any existing federal compliance standards should reflect overall state effort to promote safety.

Increased federal attention to safety education is an appropriate vehicle for federal involvement. NCSL supports federal activities which seek to identify and remove transportation operators who have a record of unsafe operation of any mode of transporation. The opening of the National Driver Register to all transportation industries supports this goal. Individual privacy should be accorded appropriate safeguards.

It is a federal responsibility to ensure the drug and alcohol-free operation of federally-regulated transportation systems, and to this end, drug and alcohol use testing is an necessary mechanism.

### HIGHWAYS

The federal government should identify and develop advisory approaches to overall highway safety. NCSL supports the full utilization of existing technology to promote safe travel. In that traffic in some cases exceeds design standards, additional safety measures should be encouraged. Such approaches, as "positive guidance" which provides the maximum amount of visual information, should be explored as a means of maximizing driving safety.

NCSL requests Congress to restore to each state the right to determine those speeds that are appropriate within its state boundaries. The existing partial restoration of this right, whereby states were permitted to increase certain rural segments to 65 mph, should be modified to eliminate arbitrary boundaries and replaced with standards founded on engineering safety considerations.

Federal speed monitoring and compliance standards, if reinstated, must be altered to more accurately reflect compliance effort and unique state circumstances.

**AVIATION**

NCSL recognizes the modernization of the nation's air traffic as a federal priority. The implementation of the National Airspace System Plan, developed to meet air traffic demands and alleviate aviation hazards, should be expedited. While the nation's aviation network does faces capacity limitations, NCSL supports the efficient utilization of existing capacity through scheduling improvements. The Federal Aviation Administration should consider providing federal incentives for non-peak service by carriers.

NCSL supports the use of Aviation and Airways Trust Fund monies for security improvements.

In the ongoing implementation of TCA's, there is a need for a more cooperative effort between users and technicians.

**MOTOR CARRIERS**

There is a continuing need for federal support of state enforcement and inspection activities. The Motor Carrier Safety Assistance Program has been important to states in this regard and should be reviewed for programmatic improvements which enhance state participation.

NCSL supports the right of the states to make determinations of reasonable "access" for motor carriers. NCSL further supports as a state option the expansion of the existing definition of "terminal."

Federal guidelines which identify safety and engineering concerns to be considered in "access" determinations would help supplement state efforts. Such guidelines should be related to vehicle operating characteristics and route specifications, but should not restrict the state decision-making process.

The fiscal realities involved in upgrading all roads and bridges to accommodate extensive expectations of "access" demand that the onus be placed on truck design that complements existing transportation networks.

States which have adopted the preponderance of the federal commercial driver's license requirements should be held in "substantial compliance" even when sanctions against drivers with blood-alcohol content (BAC) levels lower than the federal illegal standard are not adopted.

Federal support for research and development of technology which facilitates motor carrier safety should be increased, particularly that which provides information on safety compliance.

**WATERWAYS**

NCSL endorses an increased state role in disciplinary actions against unsafe boat pilots. The responsbility of employers of boat pilots to fully investigate the pilot's history in operating modes of transportation should be upheld by the federal government.

NCSL supports the conformance of federal boating-while-intoxicated standards to any enacted state BAC standard.

# STATE BUDGET UPDATE

National Conference of State Legislatures
April 1991

| State | Budget Actions | Tax Actions |
|---|---|---|
| Alabama | The Legislature will convene April 16. One issue will be how to deal with the ruling that the tax on hazardous waste is unconstitutional because it is higher for out-of-state deposits than in-state. One possibility is to make the higher rate apply retroactively to in-state sources. The revenue loss is requiring proration of general fund appropriations; that is, across-the-board cuts. | The general fund for FY1992, leaving the hazardous waste tax out of the picture, will be up only 2.2 percent. The Education Trust Fund should grow about 4.2 percent. No tax action is likely in the regular session, other than the hazardous waste issue, but the school equity lawsuits could require a special session depending on rulings. |
| Alaska | Not available. | Not available. |
| Arizona | The gubernatorial runoff election and the Azscam ethics probe have slowed budget considerations down significantly. The Legislature is now in a position to get back to budget deliberations. The Joint Legislative Budget Committee has issued budget recommendations calling for less spending than last fiscal year to balance the FY1992 budget. The governor's office issued a six point "fiscal principles" plan designed to guide budget discussions. The principles are 1) no new taxes, 2) no shifting of costs to local government or the private sector, 3) no one-time fixes, 4) no new programs without offsetting savings, 5) state money should be spent on future economic growth and 6) the state should have an ending balance of $70 million or 2 percent of the general fund. | No new taxes recommended by either the governor or the Legislature. |

2039

| State | Budget Actions | Tax Actions |
|---|---|---|
| Arizona (continued) | The Joint Legislative Budget Committee's recommendations have approximately $130 million of funding which is inconsistent with some of the governor's principles. The JLBC accepts principles one and four but has definitional problems with principle five. The JLBC recommendations are inconsistent with principles two, three and six. The JLBC budget proposes $40 million in savings from cost shifting to locals and the private sector. These shifts include freezing urban revenue sharing at FY1991 levels; private sector fee increases for contractors, railroads and agriculture; and billing adjustments for the Arizona Health Care Cost Containment System (AHCCS). The JLBC also recommends several one-time savings such as fund transfers and delaying equipment purchases and capital construction. Finally, the JLBC differs with the governor in recommending a $45 million carryforward versus $75 million. | |
| Arkansas | Current revenues are running $18.5 million above forecast. Revenue estimate for FY1992 is for a growth of $16 million over FY1991. | Corporate income tax was raised by 1 percent. Gasoline tax was raised by 5 cents and diesel by 6 cents per gallon. Sales tax was increased. Cigarette tax will likely be increased. Initial fee on state driver's licenses also to be increased. Medicaid provider tax likely to be passed. |
| California | The potential deficit for the next 18 months is estimated at $12.6 billion. A bipartisan group of legislators is currently working together with the governor on a budget plan. The budget is ahead of schedule. A hiring and contract freeze is in effect. No furloughs have been proposed. A change in entitlement programs is proposed to reduce expenditures. | No change. |

2040

| State | Budget Actions | Tax Actions |
|---|---|---|
| Colorado | A funding package for FY1992 was introduced in the Senate during the last week in March. This package calls for a general fund appropriation of $2.69 billion; which is an increase of 82.6 million or 3.2 percent over last fiscal year. Planned K-12 funding commitments will be kept and higher education spending will be up 4 percent. Corrections received $15 million in extra funding to help get new prison facilities on line. The Department of Social Services also received additional funding to meet the costs of caseload increases. The primary budget culprit in this area was federal Medicaid mandates which cost the general fund $6.1 million. | No new taxes are proposed for FY1992. General fund revenues are projected to be up $142.8 million, or 5.5 percent, in the new fiscal year. |
| Connecticut | Legislative analysts report that FY1992 spending will increase 2.37 percent, including debt service and other adjustments; part of governor's plan is to save $400 million in personnel costs by holding salaries level, requiring higher member payments for health insurance and changing in pension funding; the alternative is 8,000 layoffs on April 1, which would save $200 million in FY1992 because of complicated and expensive provisions for dismissal. | The Joint Finance Committee is examining an alternative revenue proposal to the governor's plan. |
| Delaware | The revenue estimating conference met March 18 and revised the FY1991 estimate down $24 million and the FY1992 estimate down $35 million. This is the third consecutive reduction. The FY1991 estimate is now 5.5 percent below the original estimate. Personal income, corporation income and franchise collections are all down. The FY1991 year-end deficit is now estimated at $17 million. The governor and legislative leaders will meet in April to discuss balancing budget. The Legislature approved an early retirement plan estimated to reduce 500 or more positions and save $10 million in FY1992 and beyond. | The governor proposed no new taxes. There are some general discussions of tax increases due to new lower revenue estimate, but no concrete proposals from the governor or legislative leaders. |

2041

| State | Budget Actions | Tax Actions |
|---|---|---|
| District of Columbia | The District is currently looking at a $300 million budget problem. About $150 million of this potential deficit is due to a revenue shortfall and $40 million is due to overspending for public safety, human services and debt service. The rest of the deficit has been caused by budget decisions, failure to pass budget authorizations and payments for an accumulated past deficit. The council will vote on the FY1991 revised budget and the FY1992 budget on April 9 (D.C. has a September 30 fiscal year). | A proposal has been made to increase the cigarette tax to 30-cents per pack. |
| Florida | The budget has been passed out of committee in both houses. Maintaining service levels for all state programs is a major concern of the Legislature. | No major taxes to go along with FY1992 budget. |
| Georgia | The FY1992 budget of $7.9 billion was passed. It represents a 6.3 percent growth over FY1991. No cost of living increases were included in the budget. All food is taxed after the repeal of the limited food tax menu. Revenue collections are steady. | No change. |
| Hawaii | Despite anticipating a 1989-91 biennial ending balance of $175 million, the state is concerned about anticipated revenues. Tourism, which provides the major source of revenue for the state, is down. As a result, the governor proposed an emergency appropriation of $6 million for tourism advertising (the Senate has approved the bill, which is now in the House).<br><br>The state does not expect serious fiscal problems in the 1991-93 biennium, but officials know they will not enjoy the same budget luxuries as in the boom years. The ending balance for the 1991-93 biennium is targeted at $80 million to $100 million (to maintain the state's bond rating). | Several tax proposals are being considered for FY1992 including raising liquor and gas taxes and reforming the insurance premiums tax. |

2042

| State | Budget Actions | Tax Actions |
|---|---|---|
| Idaho | Idaho expects to end FY1991 with a $30.2 million surplus. Since the state is nearing completion of its legislative session, the budget for FY1992 is uncertain. Although the state expects to end FY1992 with a balanced budget, several pieces of legislation are being considered that would affect the revenue picture. | Several pieces of legislation are being considered that would affect the FY1992 revenue picture. |
| Illinois | Standard and Poors has placed the state on credit watch. Assistance payments and Medicaid caused significant budget problems. The governor is using his budget cutting powers to reduce agency spending and has put a freeze of capital spending. Budget cuts are projected to save $87.3 million ($49 million in general fund spending) for FY1991. State funding of local civic centers has been halted. Two thousand state jobs are expected to go unfilled to generate additional savings. But FY1992 looks better. Revenues are expected to come in fine and FY1991 bills are being deferred to FY1992. Revenue estimators project $825 million in revenue growth for FY1992 with only $220 million needed for new appropriations. The additional funds will be used to pay 1991 bills and establish a reserve to improve the state's credit standing. | A number of property tax relief measures were introduced during the recent special session. No action has been taken yet. |

2043

| State | Budget Actions | Tax Actions |
|---|---|---|
| Indiana | Legislative budget committees are awaiting the governor's next move on budget deliberations. The governor had proposed a large cut ($206 million) in education spending but has received very negative public reaction. The governor hopes that the April revenue forecast revision will yield a surplus which he has promised would go to education. If there is a surplus it does not appear it will be large. Most other spending categories of the state's budget are scheduled for no increase for FY1992, including no adjustment for inflation. State agencies have been asked to find places to cut their budgets and the governor is proposing no pay increase for state employees. The governor is also proposing that locals increase the property tax. Senate Democrats have released their budget proposals which include increases in support for local schools, and employee salary and benefit increases. Republican proposals include agency reductions and restoration of teacher social security reimbursements along with limitations on higher education bond issuance and use of lottery appropriations for capital projects. Both parties are talking about using the $321 million rainy day fund and the $144 million tuition reserve fund to deal with budget problems. | Senate Democrats have proposed increases in corporate and personal income taxes and cigarette taxes. Republicans want no new taxes. |
| Iowa | The Legislature passed a $60 million de-appropriations bill in February and a $30 million supplemental for human services and other programs in early March. A second supplemental ($10 million) for human services is possible. Revenues continue to come in slightly below projections, with the state anticipating an $18 million surplus for FY1991. For FY1992, the governor has proposed an austerity budget with no tax increases, no major new initiatives and no pay increases for state employees. | The governor proposed no tax increases, and the Legislature is likely to agree. |

2044

| State | Budget Actions | Tax Actions |
|---|---|---|
| Kansas | The basic budget situation in Kansas is unchanged. Most appropriations bills are being reduced. Education has received a 2.5 percent cut. The House and Senate have just "turned over" their appropriations bills to each other. Budget policy positions in the two houses are not clearly delineated and probably will not be until conference committee. | The House is considering an income tax measure and the whole Legislature is struggling with the issue of reduction of property taxes. |
| Kentucky | No session this year. Revenues continue at projections, indicating that Kentucky is weathering the recession well. | No session this year; no tax proposals. |
| Louisiana | Louisiana reports that it will end FY1991 with a general fund surplus of $437 million. The size of the anticipated FY1992 shortfall (estimated at $911 million in February) has increased to $921 million. Proposed actions to eliminate the shortfall include a transfer of $386 million from the FY1991 surplus, budget cuts and an extension of the suspension of selected sales tax exemptions, which raises $310 million annually. Since the state Constitution prohibits tax increases in regular sessions in odd-numbered years, the Legislature will convene in a special session (April 1-8) to consider continued suspension of the sales tax exemptions. A second special session (April 8-15) will be called to address reapportionment. The Legislature will convene its regular session on April 15. | Since the state Constitution prohibits tax increases in regular sessions in odd-numbered years, the Legislature will convene in a special session (April 1-8) to consider continued suspension of the sales tax exemptions. |

2045

| State | Budget Actions | Tax Actions |
|---|---|---|
| Maine | The governor signed a bill to close the $110 million FY1991 budget gap and provide $70 million in supplemental appropriations. Supplementals included AFDC, local aid, Medicaid, overtime in corrections and mental health, and $6.5 million to continue health programs for the uninsured. The bill also included $43 million in cuts for state agencies, reclaiming $49 million in surplus from the retirement fund, three furlough days for all state employees before June 1, and advancing the payday for state employees by one day.<br><br>The Legislature now turns to the FY1992 budget. The deficit is projected at over $700 million for the 1992-93 biennium out of a total budget of $3.25 billion. The governor's proposals include increasing state employees' insurance co-payments and retirement contributions. | The FY1991 deficit elimination bill included the following: changes in filing dates for corporate taxes, accelerating sales and personal income collection dates, borrowing $15 million from the Maine Turnpike Authority, and delaying the effective date of the Investment Tax Credit.<br><br>The governor's FY1992 proposal includes: postponing numerous tax reductions already on the books, reducing the property tax circuitbreaker, and hiring new revenue collection agents.<br><br>Legislative tax proposals include raising the sales tax rate and broadening the sales tax base. |
| Maryland | The FY1991 budget deficit has increased from $443 million (in February) to $553 million (in March). $454 million of the total deficit is due to a revenue shortfall; the remaining amount is due to deficiencies in appropriations.<br><br>Strategies to eliminate the shortfall include cutting the budget by $220 million, transferring $300 million from other funds (e.g., rainy day fund) and increasing fees $30 million by making small adjustments.<br><br>The FY1992 budget deficit is estimated to be $192 million. $117 million of the shortfall will be eliminated through budget reductions; the remaining amount will be covered by revenue enhancements. | No tax proposals for FY1991. Small adjustments to fees are expected to raise $30 million.<br><br>The General Assembly will consider a $75 million tax package for FY1992. The package will include increasing cigarette taxes and closing minor loopholes in the sales tax. The General Assembly also will consider changing the 40 percent capital gains exclusion. |

2046

| State | Budget Actions | Tax Actions |
|---|---|---|
| Massachusetts | The Legislature sent a proposal to the governor for balancing the FY1991 shortfall; it includes debt refinancing, asset sales, postponement of pension payments, furloughs, across-the-board spending reductions and minor Medicaid cuts. Most of the FY1991 shortfall is due to poor revenue performance; the shortfall will likely fall 9 percent to 10 percent below original projections. The governor's FY1992 budget proposals call for a combination of reduced spending and increased revenue strategies; the Legislature has yet to consider FY1992 proposals. | No new taxes or tax increases have been proposed. Fee increases are much more likely. |
| Michigan | The FY1991 budget shortfall reached $1,137 million, but cuts of $536.3 million (through 9.2 percent across-the-board cuts) have reduced the shortfall to $600.7 million. This remaining shortfall will be eliminated using a combination of techniques including a transfer from the rainy day fund, use of one-time revenue (inter-fund borrowing, refinancing debt), accounting adjustments and implementing additional expenditure reductions. The Legislature enacted supplemental appropriations to avoid anticipated layoffs (some layoffs are being delayed by lawsuits).<br><br>For FY1992, the governor has proposed a budget that fits within the revenue estimate. His proposal includes a net $280 million property tax cut. | None for FY1991 or FY1992. |

2047

| State | Budget Actions | Tax Actions |
|---|---|---|
| Minnesota | The governor's budget would close part of the $1.2 billion budget gap in FY1992 by reducing local aid $650 million, reducing higher education 2 percent ($30 million) below FY1991 levels, and reducing human services programs. The governor is still opposed to tapping the $500 million rainy day fund. The Legislature has expressed strong opposition to the governor's cuts in local aid, although there is an acknowledgement that spending cuts are necessary. | The governor proposed: conforming to the federal income tax ($80 million in biennium), raising the cigarette tax (from $.38 to $.62 per pack) and raising the alcoholic beverage taxes. The sin taxes would raise $270 million in the biennium. The governor also wants to change the current classified property tax system in a way that would increase property taxes for residences worth less than $68,000 and reduce property taxes for homes worth more than $100,000 and for businesses. Part of the increase for lower valued homes would be offset by an expansion of funding for the circuitbreaker program. However, legislative leaders have expressed strong opposition to the property tax change, and the governor appears to be backtracking on it. |
| Mississippi | The House removed the Senate's proposal to adopt the Arkansas A-B-C budgeting system, but left the requirement that state employment fall 10 percent by July 1, 1995 and retained some cash management reform. | The House shucked the Senate tax bill and substituted a 1-cent sales tax increase (to raise $135 million in FY1992). The lottery seems less and less likely as opposition among the voters becomes clearer. |
| Missouri | The budget situation is poor in Missouri. Revenues are $250 million off from projections, mainly from a drop in sales taxes, and expenditures are high due to the effect of federal Medicaid mandates and court ordered desegregation. The state is netting $75 million through an arrangement with the state Hospital Association, whereby the state receives $75 million in donations from the hospitals to help with the state Medicaid match and agrees to increased hospital rates for Medicaid services. Social services, Medicaid, AFDC, foster care and paymeats to schools have been exempted from budget cuts. Higher education may be cut 6 percent and all other state spending will be cut 10 percent. | The speaker may propose a tax package. |

2048

| State | Budget Actions | Tax Actions |
|---|---|---|
| Montana | Midway through the budget process, fiscal staff recommended a $10 million downward revision of the revenue estimate; the Legislature, however, chose to adopt the original estimate. The anticipated fiscal year-end general fund balance is $49 million, down from $70 million last month. State employee pay increases are not yet funded, and a foundation program is expected to require $40 million new dollars. The state's portion of Medicaid is projected to increase 19 percent over the next biennium. | Concern about oil prices and severance tax collections continues. The Senate passed a bill to tax retirees, which would generate $15 million in additional revenues. |
| Nebraska | The Budget Committee is proposing a 4 percent cut in all operations from the current services levels; $16 million more in cuts will be needed but there is no proposal yet.<br><br>There are no proposals to raise new revenues. The major tax issue has been a property tax relief plan, but a state Supreme Court decision will force the state to equalize $34 million to $40 million in refunds by local governments. The new issue is: Should the state help the locals out? | |
| Nevada | The $116 million general fund surplus projection will probably be lowered by $10 million in April, with a target carryover of $50-55 million. Supplemental appropriations for aid to education are expected. A combination of some type of revenue increase combined with spending cuts is likely. | In mid-session the Legislature doesn't appear to favor the governor's proposed Business Activity Tax (BAT). Gaming tax collections continue healthy. But there has been an unexpected downturn in sales tax collections (growth over last year is at 5 percent instead of the projected 6.5 percent). |

2049

| State | Budget Actions | Tax Actions |
|---|---|---|
| New Hampshire | The FY1991 supplemental budget is in the Senate. Revenues from existing sources will not fund a continuation level budget for the next biennium. House Appropriations has reported out a budget within the revenue forecast, but well below continuation. The budget bill has been supplemented with an "additional needs" bill which is not funded, and the Legislature's revenue estimate is below the governor's. | The House approved a temporary 1 percent increase in the business profits tax; governor threatens to veto creation of either income or sales tax. |
| New Jersey | New Jersey reports that its FY1991 budget shortfall is currently estimated at $703 million: $100 million is due to additional spending needs ($85 million for Medicaid and $15 million for miscellaneous programs) and $603 million is due to revenue shortfalls. The state will have a better idea of its fiscal situation in May after three-fourths of the annual tax collections have been tabulated. To deal with the budget shortfall the state has or will:<br>o Implement layoffs;<br>o Enact an 8 percent across-the-board reduction (imposed by executive order);<br>o Ban out-of-state travel;<br>o Reduce the state motor pool;<br>o Delay or cancel capital projects.<br><br>In addition to current budget problems, state officials expect a shortfall of approximately $12 million for FY1992. This amount is based on the budget as proposed which includes nearly $800 million in additional resources (including $388 million from employee givebacks), employee layoffs, hiring and wage freezes for state employees, and cuts in state aid and grants. Not surprisingly, employee unions are adamantly opposed to the proposals affecting state employees. | State officials will not consider additional taxes for FY1991. (In their 1990 session, the state raised taxes by $2.6 billion--effective for FY1991).<br><br>The FY1992 budget as proposed includes $800 million in additional resources. $388 million in employee givebacks (removal of COLAs, reduction in fringe benefits, etc.), $400 million in one-time revenues derived from the sale of state roads to the New Jersey Turnpike Authority, and other miscellaneous sources of revenue. |

2050

| State | Budget Actions | Tax Actions |
|---|---|---|
| New Mexico | Session is over and the governor has signed the general appropriations act. The state can meet its financial obligations for the next year. The executive reduced the FY1992 revenue estimate by $33 million because of reduced corporate income tax returns as well as volatile oil prices. He also reduced the current year estimate, financing $25 million out of operating reserves and some earmarked funds to meet current-year appropriations. The revenue shortfall was due in large part to $18 million in corporate income tax refunds. For FY1992 there is a 3.5 percent increase in general fund spending that includes a state employee salary increase of 1.5 percent. The trend continues of increased spending for social programs, particularly for home placement of developmentally disabled people. The state was also able to fund first grade class size reduction. The upward spiral in Medicaid spending continues, though the state benefits from a 73/27 match. A special session on reapportionment is scheduled for September. | There were no general tax increases, though the tax rate on insurance firms was equalized (a revenue-neutral act). |
| New York | FY1992 began April 1, with no agreement between the Legislature and the governor on the budget. The state is facing a $6 billion deficit. The speaker of the Assembly proposed an alternative to the governor's budget. The speaker's budget proposal essentially offers the same amount in spending and the same amount in budget cuts as the governor's. The difference is in the mechanisms for revenue generation. Another part of the budget proposal is to extend the fiscal year by three months in order to bring the state in line with most other states' fiscal year. | No change. |

2051

| State | Budget Actions | Tax Actions |
|---|---|---|
| North Carolina | The current shortfall is to be covered by 2.2 percent agency spending cuts, use of entire $141 million rainy day fund, deletion of 43 percent of authorized capital projects and a hiring freeze. The FY1992 shortfall is $779.2 million on a continuation budget. | No change. |
| North Dakota | Session wrap-up is close and revenues are still holding to early estimates. The Legislature is expected to come in close to the governor's recommended spending for the next biennium--$1.167 billion. A March 1 estimate lowered 1991-93 revenues by $2.8 million. With a beginning $105 million general fund balance, the state now expects to end the next biennium with a $40 million balance. | Although some ground was lost to lower oil prices, sales, personal and corporate income tax collections were stronger than expected (up $6 million for FY1991). No new major taxes have been proposed, but the cigarette tax due to sunset will continue and the Sunday shopping just approved this session is expected to generate $16.3 million in additional revenues for 1991-93. |
| Ohio | Ohio reports that its budget shortfall is $477 million. Although the state met its revenue estimate for February, March revenues are down by $50 million. The shortfall will be addressed through a combination of cuts and one-time revenue sources such as transfers from the budget stabilization fund and excess lottery profits.<br><br>A shortfall of $1 billion is expected in the first year of the 1991-93 biennium with a shortfall of $650 million in the second year. The governor's budget proposal for the biennium includes a combination of fund transfers ($130 million from the rainy day fund) and revenue increases. Additionally, the state expects to lose 1,500 employees through attrition and layoffs (and an additional 1,100 if state-run liquor stores are privatized). | No tax increases to deal with fiscal problems in the 1989-91 biennium. The Legislature may consider revenue increases for FY1992. |

2052

| State | Budget Actions | Tax Actions |
|---|---|---|
| Oklahoma | The budget outlook has not changed much. Revenues are up 3.5 percent. Last year's K-12 reform package is being funded on schedule, an increase of $100 million. Other agency budgets are being cut to fund the K-12 needs and the governor's proposal for a 12 percent increase for higher education. Federal Medicaid mandates and court ordered spending for a developmentally disabled facility are causing unexpected spending increases. Corrections spending is also a budget concern, particularly funding for staffing levels. The Legislature has not been amenable to the governor's general obligation bond proposal. | The new governor says no new taxes without a vote of the people. There are two tax cut measures moving through the Legislature. The first would create double tax exempt status for local government bonds and the second would reduce the state tax on parimutuel horse racing. |
| Oregon | The March revenue estimate is up because of increased collections due to a healthy economy. However, an additional $633 million must be found for school funding purposes, necessitating agency cuts of 10 percent to 15 percent. The state expects a $384 million general fund balance for the current biennium ending in June, but the 1991-93 biennial budget will require $1.76 billion more for education. Other new programs are unlikely. | Personal income tax collections have led to an increase in the March revenue estimate. The Legislature has shown little support for the governor's proposal to institute a sales tax. No other significant revenue-raising proposals are on the table. |
| Pennsylvania | The first supplemental appropriation has been drawn from state's rainy day fund ($133.8 million). The first round of layoffs numbers 1,500. Non-union employees took a pay cut. | No change. |
| Puerto Rico | Current budget saving measures include a hiring freeze and an attrition program in all agencies. Puerto Rico is facing a tighter budget after the sale of the government-owned telephone monopoly fell through. The governor is almost two months late in presenting his budget. | Consideration of placing an excise tax on non-alcoholic beverages for the purpose of funding the government-owned Children's Hospital. Other taxes that may be increased include casino, liquor, candy, gasoline and diesel fuel taxes. |

| State | Budget Actions | Tax Actions |
|---|---|---|
| Rhode Island | The governor will submit his FY1992 budget on April 9. Agencies have been asked to present budgets that will fund 80 percent of current service levels. | No change. |
| South Carolina | The potential shortfall for FY1991 has been increased to $132 million. The deficit management strategy is to reduce the state agency personnel fee allocation by 3 percent and tap into the rainy day fund for $62.7 million. The revenue growth projection in FY1992 has been reduced by $32 million. | The House has proposed a increase of 5 cents per cigarette pack and a fee of $5 per Medicaid patient day. |
| South Dakota | Session is over; the budget that was passed--$517.8 million or approximately 8 percent over last year's budget--is similar to that delivered by the governor in late November--austere. The state employee salary package was approved and there was no budget cutting activity. Very little additional money was appropriated for water projects and education. The biggest increases were in social services, human services and corrections. | Revenues continue at projected levels. There were no tax increases or other tax activity of any significance. A proposed 1/2 cent sales tax increase was scuttled. The governor and majority party pushed for a 1-cent increase in the sales tax, and the Democrats countered with proposed budget cuts and taking money from reserves for education and water. No compromise was reached and the governor's budget passed. |
| Tennessee | Revenue collections continue to be disappointing; there are no budget decisions yet on FY1992. | Tax proposals are on hold; a tax increase is unlikely to pass either house this session. |
| Texas | The Legislature has agreed to finalize the state budget during regular session. The two year budget will likely be maintained. | The speaker is proposing a sales tax increase and a broadening of the tax base. Reform of the state franchise tax is also proposed. Local property taxes will be affected by the school finance bill (higher minimum effort). |

2054

| State | Budget Actions | Tax Actions |
|---|---|---|
| Utah | The governor signed a budget bill that eliminated a small FY1991 deficit ($15 million) and provided for 4 percent growth in general fund spending in FY1992. Included in the FY1992 package were a 4.5 percent salary increase for public employees, a reduction in human service budgets below current services and partial funding of enrollment growth for higher education. A special session is likely to address state bond projects. | The budget bill increased the cigarette tax $.03 per pack, for a net increase of $2.8 million, and increased various transportation fees by about $1 million. |
| Vermont | The House's version of the FY1992 budget is likely to be near the $660 million the governor recommended. At the $660 million level, and before any tax increases, the FY1992 budget is $150 million short. | Tax increases or extensions on telecommunications, the Vermont Yankee nuclear plant and motor fuel are being discussed in committees.<br><br>The House has passed a tax bill increasing the state sales tax from 4 percent to 5 percent ($29.2 million in FY1992) and extending it to wine ($1.0 million in FY1992). The bill also: extends the income tax at its current rate of 28 percent of federal liability and changes it from a flat to a three-tiered tax ($38.2 million in FY1992), increases meals and room taxes from 7 percent to 10 percent to raise $5.2 million in FY1992, increases corporate income and bank taxes to raise $5.0 million in FY1992, and increases the cigarette tax to raise $1.0 million in FY1992. The FY1992 increases total $81.6 million. Early implementation could also raise $5.9 million in FY1991, mostly from the sales tax. |

2055

| State | Budget Actions | Tax Actions |
|---|---|---|
| Virginia | The General Assembly has been wrestling with a $2.2 billion projected deficit for the 1990-92 biennium. $2 billion of this problem was due to a revenue shortfall and the remaining amount due to federal Medicaid mandates, increases in Medicaid utilization, health care inflation and Aid for Dependent Children increases. The problem is to be addressed through $1 billion in spending cuts and the remainder in fund transfers. Revenue growth was a negative 1.4 percent for FY1991. Although revenues are expected to be up in FY1992, virtually flat spending is expected. Budget cuts were arrived at by eliminating the capital outlay program, scheduling no salary increases for state employees, reducing $311 million in aid to local governments and by enacting an early retirement program designed to yield $37 million in savings. Some small agencies were eliminated such as the World Trade Agency and the Commission on the Status of Women. Other agencies received cuts of up to 20 percent. K-12 funding was originally recommended to be cut by $151 million by the governor, but the Legislature restored $46 million of that. Higher education was cut by 16 percent but tuition assistance for middle class and lower income students was increased. A proposed furlough plan for state employees was not approved. Actions to help balance the budget through transfers included three years of lottery proceeds ($552 million) which had been scheduled for capital outlay transfer to general fund operations. Increasing the projected investment yield on the state pension fund helped keep $230 million in the general fund and $100 million was transferred out of the transportation trust fund. | A tax increase was not part of the budget balancing package but several revenue actions did net $89 million. These included additional tax compliance auditors, stiffer fines for delinquent tax payers and deferral of corporate tax reductions. |

2056

| State | Budget Actions | Tax Actions |
|---|---|---|
| Washington | The official revenue forecast released March 15 showed that the state collected $193 million above the estimate for the 1989-91 biennium. This will help relieve the budget crunch for the 1991-93 biennium. To balance his 1991-93 budget, the governor has proposed increasing user fees. | For 1991-93, the governor has proposed increasing various user fees (e.g., filing fees for non-profit corporations, environmental fees, and hunting and fishing licenses). |
| West Virginia | The economy continues to outperform expectations; FY1991 revenues through March 12 were $19 million above estimate. Severance tax collections continue strong, and both the personal income and sales taxes are running above estimates. The Legislature passed and sent to the governor a FY1992 budget with no major new spending initiatives or reductions. Legislators included contingent appropriations language that would allocate a projected $23 million FY1991 surplus to various programs. Any surplus above this level would be used to fund the teacher salary increases approved in 1990. Current law requires the state to borrow $50 million from state retirement funds to cover the salary increases. Proposals to consolidate state medical schools and overhaul the state's health care programs were postponed until next year, when study commissions will report back to the Legislature. | No tax increases were included in the FY1992 budget. |

2057

| State | Budget Actions | Tax Actions |
|---|---|---|
| Wisconsin | The governor submitted a budget on February 7 that does not raise general fund taxes, holds increases in K-12 education below historical growth, and uses lottery funds to replace general fund spending for local aid and other programs. The FY1991 budget is projected to end in balance, although the Legislature is likely to consider a $45 million supplemental for Medicaid sometime in April. The outlook for the FY1992-93 biennium will be more clear in April, when the Legislative Fiscal Bureau releases a key budget estimate. Except for the supplemental, major budget decisions are on hold until the estimate is released. Indications at this point are that revenues are slightly below estimate, but Wisconsin seems to be weathering the recession better than other states. | Although the prospect for tax increases will be clearer after the April budget estimate is released, broad based increases are unlikely. The governor is firmly opposed to tax increases, and absent a major revenue shortfall, the Legislature is unlikely to press for them. |
| Wyoming | Session is over and the prospects are good for FY1991. The revenue estimating group scheduled to meet in May will probably lower the estimate on oil prices. The general fund is $9.4 million in the hole for the 1991-92 biennium, but of $50.9 million in the budget reserve account, approximately $20 million is marked to cover the general fund shortfall. The total budget appropriation is $1.3 billion including federal funds, of which $69.5 million was appropriated in this session. The $629.2 million general fund budget includes $39.5 million appropriated this session. A new education funding formula designed to correct distributional inequities will cost overall an additional $45 million per year when its 5-year phase-in is completed. Meeting the requirements of a court decision on the state training school for the developmentally disabled may cost a total of $20-30 million, some of which may be reimbursable by Medicaid waivers. Its first year costs are $6.1 million. | Revenues continue to run above last year, with sales tax collections up by $7 million or about 10 percent. Mineral royalties and interest income are also ahead. Severance taxes are less clear. No significant tax activity occurred during session. |

2058

## Commonwealth Policy Goals

1. Renew and recapitalize the federal, state and local partnership through at least a four year re-authorization of the federal surface transportation program by September 30, 1991.

2. Oppose any use of the Highway Trust Fund revenue sources for deficit reduction, other infrastructure or any non-transportation purposes.

3. Release to the states the Highway Trust Fund revenues already collected and minimize exemptions and diversions from the Highway Trust Fund.

4. Provide obligation authority for Virginia's estimated $200 million apportionment balance at the expiration of the current law, in addition to, and not as replacement for, regular apportionments.

5. Provide substantial increases in federal funding for highways and public transportation.

6. Provide for preservation, improvement and capacity expansion of the nation's aging Interstate system and other key nation- highways through designation of a national highway sy-

funding levels that provide at least $400 million per year to the Commonwealth of Virginia for the existing system.

7. Continue separate federal programs for public transportation and provide increased funding through stable, reliable and predictable revenue sources.

8. Require full apportionment of federal Highway Funds to states employing use-based allocation processes and reducing the number of program categories.

9. Create a flexible, consolidated highway program for other roads and bridges, a separate flexible program for transit, and provide incentives for increased coordination of these programs with other modes of transportation.

10. Create greater flexibility for state and local governments to blend revenue sources; establish incentives to employ creative financing techniques; and, provide rewards for use of additional state, local and private resources for transportation purposes. Tolls should be permissible where practical and necessary on new federally assisted projects and on existing facilities, including the Interstate system, for capacity expansion and improvements.

11. Incorporate and enhance the existing advance construction and advanced right-of-way acquisition provisions in the new program.

12. Increase federal investment in research and development. Obtain federal involvement in the Commonwealth's development and demonstration of new technologies, such as Intelligent Vehicle Highway Systems (IVHS) and advanced transit technologies.

13. Reevaluate the relative cost and effectiveness of federal sanctions and mandates which withhold Highway Trust Fund revenues from state and local governments as a punitive means to enforce various federal requirements.

NATIONAL
ASSOCIATION
of
COUNTIES

440 First St. NW, Washington, DC 20001
202/393-6226

STATEMENT BY

THE HONORABLE ANDREW WARREN

COMMISSIONER, BUCKS COUNTY, PENNSYLVANIA

AND

VICE CHAIR, TRANSPORTATION STEERING COMMITTEE

NATIONAL ASSOCIATION OF COUNTIES

ON

SURFACE TRANSPORTATION LEGISLATION

BEFORE

THE SUBCOMMITTEE ON SURFACE TRANSPORTATION

HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

ON BEHALF OF

THE NATIONAL ASSOCIATION OF COUNTIES

APRIL 18, 1991

WASHINGTON, DC

MR. CHAIRMAN:

MY NAME IS ANDY WARREN. I AM A COMMISSIONER IN BUCKS COUNTY, PENNSYLVANIA AND TODAY AM REPRESENTING THE NATIONAL ASSOCIATION OF COUNTIES (NACO)* WHERE I SERVE AS VICE CHAIR OF THE TRANSPORTATION STEERING COMMITTEE. I AM PLEASED TO BE HERE TODAY TO PRESENT THE VIEWS OF NACO ON THE SURFACE TRANSPORTATION PROGRAM.

BUCKS COUNTY IS A SUBURB OF PHILADELPHIA WITH A POPULATION OF 560,000. ASIDE FROM EXPERIENCING A DRAMATIC POPULATION INCREASE OVER THE PAST DECADE, WE HAVE ALSO SEEN A CHANGE IN COMMUTE PATTERNS TO THE EXTENT THAT THERE IS NOW A SUBSTANTIAL REVERSE COMMUTE FROM THE CENTRAL CITY PHILADELPHIA TO PLACES OF BUSINESS IN BUCKS COUNTY. THERE ARE NO NEW ROADS BEING BUILT TO ADDRESS THIS COMMUTING PROBLEMS. ADDITIONALLY, INTERSTATE 95, WHICH GOES THROUGH BUCKS COUNTY, IS NOW BEING USED INCREASINGLY AS A LOCAL ROAD AND AVERAGES 19 MPH AT RUSH HOUR WITH SPEEDS EXPECTED TO DECREASE 2 PER CENT ANNUALLY OVER THE NEXT FIVE YEARS.

---

*The National Association of Counties is the only national organization representing county government in the United States. Through its membership, urban, suburban and rural counties join together to build effective, responsive county government. The goals of the organization are to: improve county government; act as a liaison between the nation's counties and other levels of government; achieve public understanding of the role of counties in the federal system.

I RECENTLY CHAIRED A STUDY ON TRANSPORTATION FINANCING WHICH ESTIMATED THAT $4 BILLION WOULD BE NEEDED OVER THE NEXT TEN YEARS JUST TO KEEP OUR MASS TRANSIT SYSTEM MAINTAINED IN GOOD CONDITION WITH NO EXPANSION WHATSOEVER. OUR TRANSIT SYSTEM, THE SOUTHEASTERN PENNSYLVANIA TRANSPORTATION AUTHORITY ON WHOSE BOARD I SIT, IS ON THE VERGE OF BANKRUPTCY IN PART BECAUSE OF FEDERAL CUTS IN THE TRANSIT PROGRAM AND IN PART BECAUSE OF PENNSYLVANIA'S FAILURE TO ENACT A DEDICATED SOURCE OF FUNDING FOR TRANSIT.

I HAVE STATED THESE CONCERNS NOT ONLY TO HIGHLIGHT CONDITIONS IN BUCKS COUNTY BUT TO ILLUSTRATE SOME OF THE POINTS WHICH NACO BELIEVES MUST BE FA TORED INTO ANY REWRITE OF THE SURFACE TRANSPORTATION ACT. WE HAVE INTERSTATES BEING USED AS LOCAL ROADS, WE HAVE A TRANSIT SYSTEM WHICH HAS BEEN SEVEPELY IMPACTED BY CUTBACKS IN FEDERAL FUNDING, AND A SUBURBAN MOBILITY PROBLEM WHICH IS BEING IGNORED.

LET ME COMMENT ON WHERE NACO BELIEVES THE SURFACE TRANSPORTATION LEGISLATION SHOULD BE HEADING. THE COMPETITIVENESS OF AMERICAN GOODS AND SERVICES IS UNDERMINED BY NOT INVESTING IN HIGHWAYS, BRIDGES AND MASS TRANSIT. RATHER THAN SIMPLY MEASURING TRAFFIC OR RIDERSHIP, WE MUST MAKE DECISIONS BASED ON STRENGTHENING OUR ECONOMY AND MAKING OUR GOODS AND SERVICES COMPETITIVE ON AN INTERNATIONAL AS WELL AS NATIONAL LEVEL. THE CHOKE POINTS OF OUR ECONOMY ARE IN OUR SUBURBAN AND RURAL AREAS. IN SUBURBIA, CONGESTION ADDS BILLIONS OF WASTED DOLLARS TO THE COSTS OF MOVING

GOODS, SERVICES AND PEOPLE. IN OUR RURAL AREAS UNDERINVESTMENT IN HIGHWAYS AND ACCELERATED DETERIORATION OF THESE SAME ROADS MAKE IT MORE EXPENSIVE TO MOVE COMMODITIES AND DISCOURAGES NEW ECONOMIC ACTIVITY.

NACO BELIEVES THAT THE FEDERAL GOVERNMENT NEEDS TO INVEST MORE MONEY IN SURFACE TRANSPORTATION. COUNTY, CITY AND STATE GOVERNMENTS HAVE BEEN INCREASING THEIR INVESTMENT AND IT IS TIME FOR THE FEDERAL GOVERNMENT TO INCREASE THEIR SHARE.

LET ME TALK ABOUT THE FINANCING AND STRUCTURE OF THE FEDERAL HIGHWAY PROGRAM. WE WANT TO SEE ALL THE FUNDS COLLECTED IN THE TRUST FUND SPENT FOR HIGHWAY AND BRIDGE PURPOSES AND NOT USED FOR DEFICIT REDUCTION OR ANY NON-TRANSPORTATION PURPOSE. ADDITIONALLY, NACO SUPPORTS CONTINUING THE SAME MATCH RATIOS IN THE HIGHWAY AND TRANSIT PROGRAMS.

THE HIGHWAY PROGRAM SHOULD HAVE FOUR BASIC PROGRAMS AND FOR THE PURPOSES OF THIS TESTIMONY LET US ASSUME AN ANNUAL OBLIGATION LEVEL OF APPROXIMATELY $16.0 BILLION, SLIGHTLY ABOVE THE LEVEL RECOMMENDED BY THE HOUSE BUDGET COMMITTEE. THE FIRST PROGRAM WOULD BE A URBAN/SUBURBAN MOBILITY PROGRAM FUNDED AT $2.0 BILLION. THE NEXT WOULD BE A RURAL ACCESS PROGRAM AT $2.0 BILLION. THE THIRD A BRIDGE PROGRAM FUNDED AT $2.95 BILLION.

THE FINAL PROGRAM WOULD BE A INTERSTATE/PRIMARY BLOCK GRANT SOMEWHAT ANALOGOUS TO THE THE ADMINISTRATION'S NATIONAL HIGHWAY SYSTEM BUT WITH MORE MILEAGE. IT WOULD BE FUNDED AT $7.85 BILLION ANNUALLY.

IT IS NACO'S VIEW THAT THE LEGISLATION SHOULD CONTAIN BOTH AN URBAN/SUBURBAN MOBILITY PROGRAM AND A RURAL PROGRAM. THEY SHOULD BE SEPARATE BECAUSE THE PROBLEMS OF URBAN AND RURAL AMERICA ARE SUBSTANTIALLY DIFFERENT. WE ARE ALSO CONCERNED THAT THE PROCESS OF DIVIDING UP A BLOCK GRANT SUCH AS PROPOSED BY THE ADMINISTRATION COULD BECOME A VERY POLITICAL PROCESS AT THE STATE LEVEL.

AN URBAN/SUBURBAN PROGRAM SHOULD START WITH THOSE ROADS CURRENTLY ON THE URBAN SYSTEM. THE PROGRAM SHOULD BE USED TO UPGRADE EXISTING COUNTY, CITY AND STATE ROADS FOR THE PURPOSES OF RELIEVING CONGESTION AND FOR THE CONSTRUCTION OF NEW ROUTES TO CARRY INCREASING TRAFFIC. WHILE THE CONSTRAINTS OF THE CLEAN AIR LEGISLATION ARE PRESENT IN SOME COMMUNITIES, THERE ARE STILL MANY URBAN AREAS WHERE NEW CAPACITY CAN OCCUR. IN AREAS OVER 200,000 THE FUNDS WOULD BE PASSED THROUGH TO COUNTIES AND OTHER LOCAL GOVERNMENTS AND IN AREAS OF 5,000-200,000 THE STATE WOULD ADMINISTER THE PROGRAM IN CLOSE CONSULTATION WITH LOCAL GOVERNMENT. NACO ALSO BELIEVES THAT THIS PROGRAM SHOULD HAVE THE FLEXIBILITY TO ALLOW AT THE OPTION OF LOCAL GOVERNMENT OFFICIALS UPTO 100 PER CENT OF THE FUNDS TO BE SPENT ON MASS TRANSIT.

THE RURAL ACCESS PROGRAM WOULD BE DIRECTED TOWARD THE UPGRADING OF WHAT IS NOW KNOWN AS THE SECONDARY ROAD PROGRAM. GOOD SECONDARY ROADS IN RURAL AREAS PROVIDE ACCESS TO INTERSTATES AND PRIMARY SYSTEMS AND ARE KEY FACTORS TO THE REVITALIZATION OF AMERICA'S RURAL COMMUNITIES AND TO THE AGRICULTURE, LOGGING, MINING AND TOURISM INDUSTRIES. HOWEVER, IT IS THE SECONDARY SYSTEM WHICH HAS RECEIVED THE LEAST ATTENTION FROM THE FEDERAL GOVERNMENT OF ANY OF THE NATIONAL SYSTEMS. HIGH TRANSPORTATION COSTS TO INDUSTRIES CAUSED BY POOR ROADS IN RURAL AREAS MEANS HIGHER COSTS TO THE NATIONAL ECONOMY AS A WHOLE. WE BELIEVE THAT THIS SYSTEM CAN CONTINUE TO BE ADMINISTERED BY THE STATES BUT WITH MUCH STRONGER INPUT BY COUNTY OFFICIALS IN THE ALLOCATION, PLANNING AND PROJECT SELECTION PROCESS.

LIKE THE ADMINISTRATION, WE BELIEVE THE BRIDGE PROGRAM SHOULD CONTINUE TO REMAIN SEPARATE. HISTORICALLY, THE BRIDGE PROGRAM HAS PROVIDED COUNTY GOVERNMENT WITH THE LARGEST NUMBER OF FEDERAL HIGHWAY DOLLARS AS COMPARED TO THE OTHER CATEGORIES. COUNTIES ARE RESPONSIBLE FOR A SUBSTANTIAL PERCENTAGE OF BOTH THE NATION'S BRIDGES AND THOSE WHICH ARE CLASSIFIED AS EITHER DEFICIENT OR OBSOLETE. WE WOULD, HOWEVER, LIKE TO SEE THE PERCENTAGE OF THE PROGRAM DEDICATED TO OFF-SYSTEM BRIDGES INCREASED.

NACO BELIEVES WE SHOULD PROTECT OUR INVESTMENT IN THE INTERSTATE AND PRIMARY PROGRAMS. WE CALL FOR A MERGED INTERSTATE/PRIMARY

PROGRAM WHERE THE STATES WOULD GENERALLY HAVE THE FLEXIBILITY TO SPEND FEDERAL FUNDS AS THEY SEE FIT. HOWEVER, THERE SHOULD BE EMPHASIS ON THOSE SECTIONS OF THE INTERSTATE AND PRIMARY SYSTEMS WHERE EXPANSION OF CAPACITY OR REHABILITATION WILL LEAD TO REDUCED CONGESTION. THE STATES SHOULD ALSO HAVE THE FLEXIBILITY TO SPEND SOME OF THOSE FUNDS ON LOWER SYSTEM IF IN THEIR BEST JUDGEMENT THE NEED EXISTED. WE THINK THE 15 PER CENT FIGURE IN THE ADMINISTRATION BILL IS TOO LOW AND SHOULD BE ADJUSTED UPWARD DEPENDING ON WHAT THE ULTIMATE MILEAGE OF THE NATIONAL SYSTEM WOULD BE---THE LOWER THE MILEAGE THE HIGHER THE PER CENTAGE.

THE MASS TRANSIT PROGRAM SHOULD BE CONTINUED IN ITS CURRENT STRUCTURE BUT WITH INCREASED FUNDING AND FLEXIBILITY. WE URGE THE CONGRESS TO SPEND DOWN THE BALANCE IN THE TRUST FUND IN ORDER TO INCREASE THE SIZE OF THE PROGRAM SO THAT IT CAN BEGIN TO MAKE UP FOR THE CUTS THAT IT HAS ABSORBED OVER THE PAST TEN YEARS.

FRANKLY, WE WOULD LIKE TO SEE A DEDICATED SOURCE FOR TRANSIT FUNDING RATHER THAN HAVE TO DEPEND ON THE GENERAL FUND WHICH IS WHERE TRANSIT HAS TAKEN ITS CUTS. HOWEVER, IF ADDITIONAL GAS TAX AUTHORITY DOES NOT APPEAR LIKELY, WE CERTAINLY SUPPORT THE USE OF GENERAL FUND MONIES.

NACO SUPPORTS THE CONTINUED FUNDING OF OPERATING ASSISTANCE FOR ALL SYSTEMS. WE WOULD LIKE TO SEE THE SECTION 9 PROGRAM BE AT

TRUE BLOCK GRANT AND ALLOW TRANSIT SYSTEMS TO USE FUNDS FOR EITHER OPERATING OR CAPITAL AS THEY SEE FIT. WE DO NOT WANT TO SEE SYSTEMS FORCED TO MAKE CAPITAL INVESTMENTS THEY DO NOT NEED WHEN THEY COULD USE THE MONEY FOR SUCH OPERATING EXPENSES SUCH AS MAINTENANCE. FINALLY, WE CALL FOR THE EXPANSION OF THE SECTION 18 PROGRAM. INCREASINGLY, RURAL AREAS ARE FINDING SMALL BUS AND VAN PROGRAMS A REAL ASSET WHICH IMPROVES THE QUALITY OF LIFE FOR A REGION'S CITIZENS.

A VERY KEY ISSUE FOR COUNTY GOVERNMENT IS STRENGTHENING THE FEDERAL-STATE-LOCAL RELATIONSHIP IN THE SURFACE TRANSPORTATION PROGRAM. THIS IS PARTICULARLY TRUE IN THE FEDERAL-AID HIGHWAY PROGRAM WHERE MANY LOCAL GOVERNMENTS HAVE NOT HAD ADEQUATE INPUT IN THE DECISIONMAKING PROCESS AS THEY HAVE HAD IN THE TRANSIT PROGRAM. IF CONGESTION, RURAL ACCESS AND ECONOMIC DEVELOPMENT ISSUES ARE GOING TO BE ADDRESSED BY THIS LEGISLATION THERE MUST BE LOCAL INPUT FOR IT IS THIS LEVEL OF GOVERNMENT WHICH IS THE MOST AFFECTED.

WHILE THE CURRENT LAW CALLS FOR "FAIR AND EQUITABLE" TREATMENT OF LOCAL GOVERNMENT AND "COOPERATION" AND "CONSULTATION" WITH LOCAL OFFICIALS, WE NEED A PROCESS TO BACK IT UP. LET ME MAKE SEVERAL SUGGESTIONS. FIRST WOULD BE A STATE LEVEL COMMISSION ATTACHED TO THE STATE DEPARTMENT OF TRANSPORTATION OR HIGHWAY DEPARTMENT CONSISTING OF REPRESENTATIVE NOMINATED BY THE STATE ASSOCIATION

OF COUNTIES, THE STATE MUNICIPAL LEAGUE AND THE GOVERNOR. IT WOULD REVIEW AND APPROVE THE PLAN DEVELOPED BY THE STATE DOT OR HIGHWAY DEPARTMENT FOR THE ALLOCATION OF FEDERAL FUNDS. IN CONJUNCTION WITH THIS REVIEW AND APPROVAL IT COULD HOLD HEARINGS AT WHICH OTHER LOCAL OFFICIALS COULD TESTIFY. THIS COMMISSION COULD DEAL WITH THE RURAL ACCESS AND URBAN/SUBURBAN MOBILITY PROGRAMS OR COULD INCLUDE ALL FEDERAL HIGHWAY PROGRAMS FOR WHICH THE STATES RECEIVE FUNDING.

ANOTHER OPTION WOULD BE FOR A NEW STATUTE TO GIVE THE STATES A LIST OF OPTIONS THEY COULD EMPLOY TO GET THE INPUT OF LOCAL OFFICIALS. STATES WOULD BE REQUIRED TO SUBMIT THEIR PLAN FOR LOCAL INPUT TO THE U.S. SECRETARY OF TRANSPORTATION FOR CERTIFICATION. IF LOCAL OFFICIALS FELT THE PLAN WAS INADEQUATE THEY COULD PETITION THE SECRETARY. THE BOTTOM LINE IS THAT THERE MUST BE A STRUCTURE IN ENSURE FAIR TREATMENT OF LOCAL ELECTED OFFICIALS.

THIS COMPLETES MY TESTIMONY. I THANK YOU, MR. CHAIRMAN AND OTHER MEMBERS OF THE SUBCOMMITTEE FOR ALLOWING NACO TO TESTIFY AND WOULD BE PLEASED TO ANSWER ANY QUESTIONS YOU MAY HAVE.

2071

# Statement of the

National Association of COUNTIES

# Future of the Surface Transportation Program

**This statement was originally prepared by the National Association of Counties' (NACo) Transportation Steering Committee. It was adopted by the full membership at the NACo Annual Conference in July, 1990.**

*The National Association of Counties (NACo) views the process of developing a comprehensive national program for the future of our transportation system as an important task. Secretary of Transportation Skinner early in 1990 issued the National Transportation Policy which has created a national debate on the issue. Counties own and maintain 1.7 million miles of roads or 43 percent of the total mileage in the United States; 219,000 bridges over 20 feet or 45 per cent of the bridges on the National Bridge Inventory; and own or contribute funding to 25 percent of the public transit systems. The role of the federal government in this post-Interstate era will be a crucial one as those decisions made at the federal level will most certainly impact the mobility and funding questions county officials must address at the local level. While the focus will be on surface transportation because of the reauthorization process in the highway and mass transit programs aviation and railroad issues are important to counties and are addressed in other NACo documents.*

## Basic Premise

The 43,000 mile Interstate system will be completed in 1991. County officials have supported the construction and completion of this system which has been done almost entirely with federal funds. They supported the Interstate program and investment in the primary system because it was necessary to link the various regions of the country. However, it is now time to change the emphasis of the surface transportation program and to treat local governments as equal partners. While NACo supports continued involvement by the federal government in funding some rehabilitation of the Interstate system, it is now time to allocate a greater portion of the resources of the federal highway trust fund to other systems.

Economic development needs to be a key factor in making transportation decisions in the future. The national and regional implications of such actions must be studied closely. Rather than simply measuring traffic or ridership, we must make decisions based on strengthening our economy and making our goods and services competitive on an international as well as national level. The competitiveness of American goods is undermined by not investing in highways, bridges and public transit—bad roads add costs to American products. The choke points of our economy are in our suburban and rural areas. In suburbia, congestion adds billions of wasted dollars to the cost of moving goods, services, and people. In our rural areas under investment in highways and accelerated deterioration of these same roads make it more expensive to move commodities and discourages new economic activity. Consideration also needs to be given to the implications of transportation related decisions that may result in the development of one area at the expense of another.

## Urban/Suburban Congestion

The movement of people and goods and services in urban and suburban areas is reaching a crisis stage. While it is a problem having national implications, congestion is a local concern whether it occurs on county or state roads or on an Interstate highway servicing an urban or suburban area. The Interstates, though constructed to link the nation with a good highway system, have become part of the local road network in many areas with 70 per cent of Interstate traffic now being local in nature. To the highway user it makes little difference who has responsibility for a highway system if that system is congested and not serving the needs of the local public and business community. A revised surface transportation program must consider the new development patterns in suburban counties and the implications of that growth on the ability of citizens to move around with as few constraints as reasonably possible. Such a program must also address the needs of the older urbanized areas which have suffered population decline and may have less ability to pay for improved roads and transit services,

while at the same time having areas within them which are experiencing revitalization and growth and thereby generating severe traffic congestion. Both highways and transit need to be considered as solutions.

There is no question that land use planning must be given a high priority as we devise new solutions and develop new programs to solve our growing congestion problem. We must also acknowledge that congestion contributes to a decline in air quality due to auto emissions and the deterioration of road surfaces and that the protection of our environment is an issue which is linked to future surface transportation policies.

## Rural Access

Good secondary roads and bridges in rural areas that provide access to Interstates and primary roads are key factors to the revitalization of America's rural counties and to the agricultural, logging, mining and tourism industries. However, our nation's rural secondary highways have for the last thirty years received the least attention from the federal government of any system and their condition reflects this low investment level. Additionally, a substantial number of rural bridges are considered deficient and may represent a danger to public safety. This is ironic for it was the rural farm-to-market system which was the initial reason for the federal government involvement in a national highway program.

While basic maintenance has and should continue to be the responsibility of county government, federal funding for construction and rehabilitation of highways and bridges must grow substantially. The design and capacity of many rural highways and bridges are based on traffic needs of the immediate post-World War II period. The number of trucks and other heavy equipment using these roads has been expanding and more important the weights of such vehicles has increased considerably. It is not uncommon to find trucks with a gross weight in excess of 100,000 pounds using rural roads. This increases the rate of deterioration and requires a substantially heavier investment in reconstruction to adequate standards. Railroad abandonment, which must be reversed, has moved goods off the railroads onto trucks. In 1947 there were 214,000 miles of rail roadway which then dropped to 196,000 by 1971 and to 140,000 in 1986.

## A New Surface Transportation Program

The following is a list of categories which would be eligible for funding under the new highway and mass transit program.

### 4-R/Primary Program

This program would provide federal funds to maintain and upgrade the Interstate and primary systems. However, emphasis should be placed on those sections of the Interstate and primary systems where expansion (extra lanes, for example) and rehabilitation will lead to addressing the congestion problem in urban and suburban areas.

### Urban/Suburban Mobility Program

Funding for the urban system program should be increased substantially and be directed at solving congestion and mobility problems, particularly in the larger urban areas and high growth suburban areas. This program should be used to upgrade existing county highways and where appropriate, state highways, in order to relieve traffic on the Interstate system. This program could also be used for building new routes to carry increasing traffic. At the option of local government officials, these funds could be spent on public transit.

States would administer the program in consultation with local government and/or metropolitan planning agencies where appropriate for urbanized areas between 5,000-200,000,

while the funds would be passed-through to counties and other local governments in areas above 200,000 population. NACo considers this pass through to be a key component of the future transportation program. Counties are in an excellent position to understand and undertake surface transportation projects aimed at addressing the mobility concerns of their residents. Larger counties have both the planning and engineering expertise to carry out these projects without direct state highway department involvement. In states where local government has little or no transportation responsibility, funds would be spent by the state with consultation required with local government officials on project selection.

## Rural Access Program

This program would be directed toward the upgrading, through the substantial increase in funding, of what is now known as the secondary road program. It is essential that rural roads be improved so that they can carry the much heavier loads of today's vehicles and so that they can serve as a link to the Interstate system and to various markets for the agricultural, logging, mining, manufacturing, and tourism industries. The high operating costs to these industries associated with poor roads and, in turn, the cost to the economy as a whole makes the condition of rural roads a national responsibility. Economic development in the future will be accelerated or restricted depending on how aggressively our nation upgrades the secondary road system.

This program could continue to be administered by the states with guarantees of strong county input in the allocation, planning, and project selection process. Another option would be for a consortium of rural counties to enter into an agreement which would allow them to receive funds directly from the federal government.

On roads assisted through this program, state design, environmental, and other regulatory standards would be applied. It is an inefficient use of federal funds to apply federal standards to rural roads.

## Bridge Program

The highway bridge replacement and rehabilitation program would remain a separate program. The large backlog of substandard bridges remains at a critical level and a large capital investment is required to rehabilitate and replace these bridges. Counties are responsible for a substantial percentage of both the nations' bridges and those which are classified as either structurally deficient or functionally obsolete. It is important that the percentage of the program dedicated to off-system bridges be increased.

## Public Transit

It is the intent of NACo that the transit program retain its separate identity. Transit will not succeed without a significantly increased federal subsidy, in some cases to initiate a local program and in some cases to operate it. Like the automobile owner, the transit user is entitled to a reasonable subsidy.

More flexibility should be given to recipients of federal transit funds in regard to how they can spend such funds—we should not force systems to use capital money to make investments they do not need when they would prefer to use federal money for operating expenses such as maintenance. We would also like to see transit with a dedicated source of funding such as the federal gas tax. The battles of the last ten years over the level of general fund financing have distorted the funding decisions of that industry.

Small bus and van transit systems are being used increasingly in rural areas, especially by special need groups like senior citizens. Such programs should also be maintained and expanded.

# Financing a New Surface Transportation Program

Financing the new highway and transit program is central to its formulation. NACo supports the following guidelines or principles.

## User Fees

The federal surface transportation program should be user fee based to the extent possible. The source of these user fees should continue to be the gasoline and diesel fuel taxes and the various other vehicle related taxes. All funds generated by these user fees should be dedicated to transportation and not used for deficit reduction. There should not be a turn back to the states of any of the federal gas tax authority.

## Increased Investment

All levels of government should increase funding for surface transportation programs with an emphasis on dedicated sources of revenue.

## Trust Funds

There is a substantial balance in the trust funds—this balance should be spent down and in the future all trust fund revenues and accrued interest should be allocated in a manner that reflects the spirit and original Congressional intent that accompanied the establishment of the trust funds. The spend down for the highway and transit trust funds should proceed along the following schedule:

| HIGHWAY ACCOUNT | TRANSIT ACCOUNT |
|---|---|
| FY 1991 - $2.7 billion | FY 1991 - $2.5 billion |
| FY 1992 - $2.5 billion | FY 1992 - $2.5 billion |
| FY 1993 - $2.5 billion | FY 1993 - $2.0 billion |
| FY 1994 - $3.0 billion | |

## Highway Program

In the new highway program, with the exception of Interstate construction which is eliminated, the baseline for all programs should be no less than currently authorized under the existing highway program:

Bridge - $1.6 billion
Urban/ Suburban Mobility - $750 million
Rural Access - $650 million
Interstate 4-R/Primary - $5.1 billion

The $3.0 billion presently being used for Interstate construction should be reallocated. No less than 50% or $1.5 billion should be allocated to the urban/suburban mobility, rural access, and bridge programs. The new Interstate 4-R/primary program would receive the remaining funds. This process will ensure additional federal funds for local governments.

Any new funds which become available to the highway program, i.e. funds from a trust fund spend down or from new gas tax authority, must be allocated on the following formula: 1/3 to the Interstate 4-R/primary program and 2/3 to the urban/suburban mobility, rural access and bridge programs.

## Public Transit

The national public transit program should no longer be funded from the federal general fund. The current one cent from the federal motor vehicle fuel tax now allocated to the Transit Account in the Highway Trust Fund should be augmented, without adversely affecting current and future highway funds, by a share of a new motor vehicle fuel tax to:

1) replace the current federal general fund assistance, and 2) add funding to assist local governments in the completion, upgrade and operation of our national public transit systems.

### Match Requirements

Local governments cannot be expected to increase their commitment to the federal program without a commensurate increase in the federal commitment. Local governments already match every federal dollar with three local tax dollars. It must be also recognized that financial resources of many county governments are limited by both absence of a tax base and by state imposed limits on their ability to raise and/or impose additional taxes.

### Bond Financing

Tax exempt bond funding should be available for highway and mass transit projects with a minimum number of restrictions.

## Planning/Decisionmaking Process

County support for continuing and increased federal funding in surface transportation depends on a strengthening of the federal-state-local relationship. This is true particularly for the federal-aid highway program which has not had adequate local government input. The vast amount of travel in this country is local in nature and the concerns which NACo believe need to be addressed in the post-Interstate era, i.e., congestion, rural access, and economic development, require solutions which must involve local governments.

The states have traditionally been the focal point for most federal highway funds. It can be stated fairly that fifty different systems of funding and planning exist in terms of what approach states use in the allocation of federal highway funds. New legislation should include local officials as equal partners with state officials in the decisionmaking process. The future federal transportation program should not impose a uniform decisionmaking process on all states. It should, however, recognize the degree to which county road needs exist and that these needs must be addressed in an equitable manner. A process must be created by any new surface transportation legislation to ensure that local government officials are consulted and views considered fully as funding and project selection priorities are established within a state.

## Other Issues

Mandates, safety and research and development/training are other subjects which must seriously be considered in the development of a new surface transportation program.

### Mandates

While certain federal requirements may be appropriate, others simply impose undue burdens on local governments and waste finite resources. There needs to be a differentiation made in imposing design standards at least on lower volume roads, as well as a review of those non-transportation goals which are included in federal surface transportation programs. Federal requirements attached to highway and transit funding should be reviewed and reduced.

### Safety

This concern needs to be factored into a future highway program. Clearly, deteriorating roads, deficient bridges, poor roadway design, and alcohol abuse create a safety problem on the nation's highway system. Another aspect of safety which should be addressed is to what extent the federal government will require local governments to allow large vehicles access to all roads.

## Research and Development/Training

There is an appropriate role for the federal government in this area. The federal government needs to be involved in developing new technologies for both highways and mass transit systems. With no manufacturers of rail cars left in the U.S. and the emergence of new transit technology such as magnetic levitation and linear propulsion systems, it is incumbent on the federal government to take a leading role in research and development in this field. In addition, the federal government should take a leadership role in providing up to date information on new technologies, management approaches, etc. to local government. The T-2 program is a good prototype for such a program.

For further information on the activities of NACo or to obtain copies of this report contact the National Association of Counties, 440 First Street, NW, Washington, DC, 20001. Telephone: (202) 393-6226.

## TRANSPORTATION STEERING COMMITTEE RESOLUTION ON THE FUTURE OF THE FEDERAL SURFACE TRANSPORTATION PROGRAM

**WHEREAS,** the federal surface transportation program will expire on September 30, 1991; and

**WHEREAS,** the Interstate highway system is scheduled to be completed in 1991 thereby freeing up a substantial amount of funds; and

**WHEREAS,** counties own and maintain 1.7 million miles of roads or 43 percent of the total roads in the United States and 219,000 bridges or 45 percent of the bridges in the United States; and

**WHEREAS,** counties own or contribute to the funding of 25 percent of the public transit systems; and

**WHEREAS,** the movement of people, goods and services in urban, suburban and rural areas is vital to the nation's economy and its international competitiveness; and

**WHEREAS,** traffic congestion in suburban and urban areas is reaching a crisis stage; and

**WHEREAS,** smooth flowing, well integrated highways and expanded public transit are the best methods for meeting clean air standards; and

**WHEREAS,** county government will be playing a greatly expanded role in transportation in suburban and urban areas over the next several decades; and

**WHEREAS,** the nation's system of rural roads and bridges, a key factor to the economic vitality of rural areas, is deteriorating at an accelerated rate due to its age, the increasing weights of trucks and farm equipment, and expanding use due to railroad abandonment:

**THEREFORE, BE IT RESOLVED** that the new Surface Transportation Act contain substantially increased funding for programs which provide assistance to county governments that build, own, operate, maintain, fund, or otherwise have responsibilities for highways, bridges and transit systems and a greater role in the decision making/planning function in regard to these funds;

**BE IT FURTHER RESOLVED** that the National Association of Counties endorses the following provisions for inclusion in the new legislation:

1. The highway program should be user fee based.
2. The federal subsidy for public transit should come from the transportation fuel tax.
3. The balance in the trust funds should be spent down quickly.
4. The federal-state-local relationship needs to be strengthened. Counties and cities should be considered as equal partners in the new surface transportation program. Many of the problems which need to be addressed in the future are local in nature. Therefore, a process must be established which ensures that county governments are consulted and treated as equal partners in the planning, funding allocation, and other decision making processes.
5. A program continued to provide federal funds to maintain and upgrade the Interstate and primary systems.
6. A suburban mobility program should be created, replacing the FAUS program, which would be directed at solving congestion and mobility problems in urban and high growth suburban areas. These funds should be passed through to areas in excess of 200,000 population and, at option of local officials, could be spent on mass transit.
7. A rural access program be created which would fund the secondary road system (FAS) at a substantially higher level.
8. The bridge program (HBRRP) retain its separate identity with greater funding and a higher percentage of funds dedicated to off-system bridges.
9. The mass transit program would retain its separate identity, with a dedicated source of revenue.
10. Funding for mass transit should be increased and more flexibility should be given to the recipients of transit funding as to whether funds are spent for operating or capital expenses

11. The funding baseline for all programs, except Interstate construction (which is eliminated), should be no less than currently authorized under the existing highway program.
12. The $3 billion presently going to the Interstate construction program should be reallocated with no less than 50% to the urban/suburban mobility, rural access, and bridge programs and the remainder to the Interstate 4R/primary program.
13. Any new funds for the highway program, whether from a trust fund spend down or new gasoline tax authority, must be allocated 1/3 to the Interstate 4R/primary program and 2/3 to urban/suburban mobility, rural access, and bridge programs.
14. Federal mandates attached to highway and transit funding should be reviewed. Those which impose undue burdens on county government and waste finite resources should be eliminated.
15. Safety concerns need to be factored into a future surface transportation program.
16. The federal government should take a more aggressive role in research and development/training.

# Statement of Associated Builders and Contractors

---

Presented by

Bertrand Wilson, Vice President
Barriere Construction Co.

before the

Subcommittee on Surface Transportation

House Public Works and Transportation Committee

April 18, 1991

---

**Speaking for the Merit Shop**

729 15th Street, N.W.
Washington, D.C. 20005
(202) 637-8800

Good morning. My name is Bert Wilson and I am Vice President of Barriere Construction Company, an asphalt paving contractor located in New Orleans, Louisiana. On behalf of the Associated Builders and Contractors (ABC), I appreciate this opportunity to comment on reauthorization of the nation's surface transportation programs.

Associated Builders and Contractors represents over 17,500 contractors, subcontractors, material suppliers and related firms from across the country and from all specialties in the construction industry. Our diverse membership is bound by a shared commitment to the merit shop -- the most efficient construction technique in America. The merit shop philosophy of awarding construction contracts to the lowest responsible bidder, regardless of labor affiliation, through open and competitive bidding, assures taxpayers and consumers the most value for their construction dollar. With 75 percent of construction done today by open shop contractors, ABC is proud to be their voice.

When ABC came before you a little over a year ago the Committee was in the middle of an extensive series of hearings to identify needs and priorities for this important reauthorization. Today, we come before you near the end of the process to respond to the Administration's legislative proposal and to encourage, with less than six months remaining until the September 30 deadline, a timely reauthorization.

The Administration should be commended for its long-standing commitment to improving our nation's transportation infrastructure. Over the past two years, beginning with the National Transportation Policy and now, culminating in forward-looking legislation, H.R. 1351, the Surface Transportation Assistance Act of 1991, the Administration has been open to comments and suggestions from the construction industry. ABC was proud to be part of this policy outreach effort and while not meeting all our recommendations, we are pleased H.R. 1351 incorporated many of our association's proposals.

There are two fundamental issues Congress must focus on during reauthorization: program structure and funding, both of which are intrinsically tied. Acknowledging our current fiscal situation and political climate, it is now more important than ever to have a long-term integrated transportation plan and allocate federal funds accordingly.

**PROGRAM STRUCTURE**

ABC supports the basic program structure of H.R. 1351 which recognizes financial constraints and seeks a unified approach. The five-year plan will allow for coordinated planning and the continuity necessary to meet our transportation needs of the future. ABC supports a strong federal commitment to the National Highway System and believes the two-tiered approach, focusing more federal resources on these roads of national significance will

ensure safe and reliable transportation for our national defense and interstate commerce needs.

Conversely, states will focus on internal transportation issues such as congestion relief, rural access and intermodal links. The increased flexibility of the Urban and Rural Program empowers states to choose how they will improve their condition. The capability of states to prioritize their transportation demands and allocate funding as needed is a basic necessity for transportation efficiency in the future.

The increased emphasis placed on planning in H.R. 1351 and the reliance on Metropolitan Planning Organizations will be invaluable in properly coordinating needs and planning for the future. Governmental partnerships established at every level to investigate transportation alternatives and propose solutions appropriate for specific jurisdictional boundaries will facilitate an integrated and fluid travel system.

ABC applauds the Administration's increased emphasis on innovation and technology. New technology is the investment of the future. For urban areas, where new road construction is extremely difficult, new technology such as the Intelligent Vehicle Highway System will allow for a more efficient movement of people and goods on the existing transportation network. Whether its more durable road surfaces, high speed rail or emergency vehicle control, technological innovations will save money, reduce congestion, reduce pollution and increase safety.

ABC feels strongly that a separately funded bridge program is necessary to address the dangerous condition of our bridge network. With over forty percent of our nation's bridges in substandard condition, personal safety and interstate commerce are significantly compromised. Considering the enormity of the problem, we believe the Administration's effort to establish a priority system for bridge repair is a necessary first step in upgrading our bridge network.

We encourage the Administration to consider continuation of a minimum allocation provision to ensure that states receive at least 85 percent of the money they send to Washington in the form of gas taxes. If more of the surface transportation program is to be the responsibility of the states, we believe the states should receive back a good portion of the money they contributed to the Highway Trust Fund.

**FUNDING**

Where the Administration's bill falls short, unfortunately, is in addressing one of the major problems inherent in the future stability and credibility of the program -- financing. Let's put aside the overall level of funding recommended for the program for

a moment. Until the Highway Trust Fund is made permanent and taken off-budget, the program will not be honest or whole.

ABC firmly believes that revenues raised by user fees and collected in transportation trust funds should be allocated and spent solely for their intended purposes. ABC vehemently opposes the current practice of holding money in the trust fund to mask the size of the federal deficit. While ABC supports deficit reduction, we believe it can and should be achieved through spending restraints in a manner which is equitable to all -- not by diverting dedicated trust fund revenues or by raising the gas tax for non-transportation related purposes.

The 2.5 cents diverted to the general fund last year during budget reconciliation must be returned to the Highway Trust Fund. It is appalling that the trust of the highway user has been continuously violated by the billions of dollars being withheld from urgent infrastructure improvements. To add a direct taking of this nature is the ultimate insult to highway users and dramatically undermines the program.

We applaud this Committee's attempt to regain the 2.5 cents diverted to the general fund and to achieve a spend down in the trust fund. Your recommendations to the House Budget Committee to make the program whole again and increase overall funding for transportation programs acknowledges the desperate need for infrastructure investment in this country.

Recognizing budget agreement constraints, ABC supports a total overall funding level of $23 billion each year for the duration of the reauthorization bill. While H.R. 1351 falls short of this goal, the bill has several positive financial features.

**DAVIS-BACON**

We applaud the Administration for proposing to raise the Davis-Bacon threshold to $250,000. However, we continue to support a minimum Davis-Bacon threshold on federal construction projects of one million dollars.

As you know, the Davis-Bacon Act mandates "prevailing wage" rates be paid on all federal or federally-assisted projects of $2000 or more. The original intent of the act was to protect local workers from itinerant laborers who worked for lower wages. This noble intent has been replaced by an outdated measure hampering competition, disrupting local economies and restricting job opportunities for small businesses.

With immediate needs for highway and bridge construction and repair far outstripping the supply of available funds, reform of the Davis-Bacon statute can provide additional dollars to fund our infrastructure needs.

**INNOVATIVE FINANCING**

The Administration's bill recognizes the importance of involving the private sector in infrastructure investment. The Department of Transportation proposal promotes innovative financing techniques as part of the planning process. The introduction of congestion pricing as a possible tool to reduce urban congestion and resultant pollution is just the innovative approach we need to see.

Additionally, H.R. 1351 permits commingling of private capital and federal-aid funds to develop toll roads and bridges as well as including feasibility requirements and encouraging other non-traditional public-private design, build and operate projects.

Privatization and public-private partnerships are being used more frequently to augment federal, state and local activities -- and they work. These efforts bring the experience, business savvy and financial strength of the private sector to government entities for the benefit of all. ABC believes utilization of innovative financing techniques and funding mechanisms are essential when considering the country's shrinking capital base.

**ALTERNATIVE FUELS**

While ABC endorses the Administration's effort to achieve transportation requirements of the Clean Air Act and supports promotion of alternative fuels, we believe continuation of the current gasohol exemption undermines efforts to invest in our nation's infrastructure.

The current exemption costs the Highway Trust Fund $500 million each year with an additional $200 million diverted from state and local transportation needs. Only time will tell the degree of increased diversion resulting from passage of the Clean Air Act which mandates use of oxygenated and other alternative fuels. Additionally, the Administration's National Energy Strategy, currently working its way through the legislative process, calls for the nationwide use of alternative fuels for fleet vehicles which will impose an additional and significant drain on the Highway Trust Fund.

The gasohol subsidy was originally intended to promote the use of environmentally friendly fuels. Now that Congress has mandated the use of these fuels, we believe a subsidy of this nature is no longer necessary, and at the very minimum the highway program should not bear the brunt of a subsidized alternative fuels program.

**DISADVANTAGED BUSINESS ENTERPRISE PROGRAM**

The Administration's bill continues the Disadvantaged Business

Enterprise Program (DBE) whereby 10 percent of federal-aid highway, highway safety and mass transit program funds are to be awarded to DBE contractors. This stringent 10 percent DBE requirement fails to recognize the need for flexibility and cooperation which we believe Congress had originally intended in its minority provision.

Rather than pursuing set-asides, ABC believes training and mentor programs will enable disadvantaged businesses to compete and win contracts on merit. ABC has focused a large portion of its financial, membership and staff resources on the issue of craft and supervisory training. Most recently, ABC has announced a major effort funded by nine of the nation's largest open shop contractors to develop standardized craft training to more efficiently and effectively train and upgrade the construction workforce. We have long recognized that if the United States is to foster expanded opportunities for all its citizens and maintain its competitiveness, hundreds of thousands of additional highly skilled workers will be needed between now and the year 2000. Training is the only solution.

H.R. 1351 allows a percentage of funds apportioned to the states to be available for highway construction training and funds administration of disadvantaged business proficiency programs. We believe this is a step in the right direction. Taxpayer dollars should be invested in training to help disadvantaged firms and their employees become more skilled at both the craft and management levels. Training is an investment in the future, better equipping DBE firms with the skills necessary to successfully compete in the absence of preferential treatment.

We believe the case for tightening the DBE program is even greater because of this increased assistance and would encourage the inclusion of safeguards such as a sunset provision, size restrictions for eligibility and limits on the number of contracts a DBE can obtain. These safeguards will ensure the program does not perpetuate the firms DBE status.

**SAFETY BONUS PROGRAM**

ABC adamantly opposes the use of highway funding sanctions to force state compliance with safety or environmental goals. Reducing highway fatalities through safety belt usage, motorcycle safety or alcohol awareness programs should be a top priority for every state. However, our infrastructure needs are far too immense to be held hostage to penalize states for inaction. The Administration's bill proposes a safety bonus program which rewards states for achieving highway safety goals. In addition, 10 percent of total highway funding apportioned to the states must be spent on projects which have safety benefits. We believe this is a more positive approach and will encourage states to act swiftly to meet their highway safety goals.

**CONSTRUCTION**

ABC believes federal construction contracts must be awarded to the lowest responsible bidder. It is the government's responsibility to taxpayers to obtain the lowest possible price in the procurement process through unrestricted competition. ABC supports the sealed bid method of government contracting over negotiated procurement as being simpler to administer, creating more competition, being less subject to fraud and abuse and generally insuring a higher quality product.

H.R. 1351 eliminates regulations prohibiting state transportation or highway departments from incorporating warranty or guarantee provisions into federal-aid construction contracts. We believe an additional layer of requirements are unnecessary and will be costly for government to administer. In addition, we are very concerned about the potential for inclusion and enforcement to be applied subjectively. Currently, contractors are not fully paid until they have met all requirements and specifications in their contracts. In addition, pursuant to the Miller Act, contractors on federal projects are required to be bonded -- guaranteeing the government satisfactory project completion.

**WETLANDS**

As many of you have noticed, regulatory attempts to coordinate a wetlands management program have done little to help formulate one clear policy. New development as well as improvements to roads, bridges and transit systems will increasingly fall prey to the current confusing and impractical wetlands regulations. A comprehensive wetlands management initiative is necessary to clarify, consolidate and improve upon current law.

H.R. 1351 recognizes the current wetlands dilemma and establishes eligibility of federal funds to create wetland banks or contribute to statewide programs which create, conserve or enhance wetland areas. While this bill is not the vehicle for change, we will urge the Water Resources Subcommittee to consider the effects of wetlands regulations on transportation.

In brief, ABC supports a fair and balanced approach to classifying wetlands which takes into consideration environmental benefits and economic security. Recognizing all wetland areas are not equal, ABC recommends a priority ranking system to be instituted to classify wetland areas and appropriate use. In addition, ABC supports mitigation efforts to protect and compensate for the loss and degradation of wetland functions and values.

We are at a critical juncture in the history of our nation and the history of our nation's transportation system. We must have the best, most efficient transportation network in the world if we are to compete in an increasingly global economy. If we do not act

now to rebuild our nation's foundation, America cannot expect to be the world leader in the year 2000.

I have made several recommendations I believe will stretch our declining resources and which I urge the Committee to consider carefully. Most importantly, however, we need a bill signed by the President by September 30, 1991. The enormous task of rebuilding the nation's transportation infrastructure cannot afford to be delayed.

On behalf of the Associated Builders and Contractors, I again want to thank Chairman Mineta and the Subcommittee on Surface Transportation for the opportunity to be here today. I will be happy to answer any questions you may have.

ADDITIONS TO THE RECORD

**Testimony of**

**American Motorcyclist Association**

**before the**

**Surface Transportation Subcommittee**

**regarding the**

**Reauthorization of the Federal Surface Transportation Program**

April 18, 1991

**Preface**

The American Motorcyclist Association, which represents over 200,000 motorcyclists nationwide, appreciates this opportunity to comment on the reauthorization of the Federal Highway Program and related policy matters.

The AMA urges Congress to pass a five-year measure reauthorizing the Federal Highway Program before its expiration September 30, 1991.

We believe it is essential for Congress to realize the positive benefits motorcycles offer to the current traffic mix on our nation's highways and roadways. Therefore, we encourage Congress to reject any amendments to the Surface Transportation Assistance Act which would have the effect of discouraging persons from operating a motorcycle.

Over 6 million Americans own and operate motorcycles on public highways. It is our desire to see that their concerns and interests are heard by Congress during the ensuing legislation.

**Issues**

Mandatory Helmet Requirements

The AMA opposes Congressman Cooper's H.R. 1782, which he proposes to include in the reauthorization act for federal highways. While AMA recognizes the accepted safety benefits of helmet usage, we nonetheless continue to oppose the imposition of compulsory requirements for adult cyclists. (Position paper attached)

We specifically take issue with Rep. Cooper's assertion that governmental intrusion is a "myth." Motorcyclists are no less citizens than those whom Rep. Cooper seeks to protect from "unnecessary" medical bills and pay their fair share of taxes. All we

are asking is to remain unencumbered by unnecessary governmental intrusion into our personal activities.

We further believe that, while Rep. Cooper's bill initially provides incentives, and thereafter directs states to earmark highway dollars for certain safety programs, the effect of this language is pernicious because of the known shortage of funding for highway construction. In effect, a federal incentive program will result in a defacto helmet law in a given state because of the shortage of highway funding available to states.

Currently, 23 states have full mandatory helmet laws in place for riders of all ages. Another 24 states have partial helmet laws for minor operators and passengers, and three states have no helmet law whatsoever. It is important to note that AMA does not oppose partial helmet laws for minors only. We believe that states should have jurisdiction over the welfare of its younger citizens who may lack the experience and judgement necessary to make an informed decision regarding helmet use. However, once a person reaches the age of majority, it is our fundamental belief that the decision belongs solely to the individual.

Further, AMA remains unconvinced that the so-called studies typically used by proponents of compulsory helmet laws are, in fact, accurate. There remains much scrutiny to be applied to any study which would single out any group of motorists for punitive action. Our research indicates that motorcyclists, helmeted or not, are no greater "burden" on the health care system than non-cyclists and perhaps are more likely to have adequate insurance than many motorists.

The good news is that motorcycle accidents, injuries and fatalities have plunged dramatically over the past decade. Since 1980 motorcycle related fatalities have dropped 39 percent. Perhaps not coincidentally, during this same period, motorcycle rider education became widespread and popularized riding safely. Motorcyclists have

willingly paid for these programs by agreeing to additional state licensing fees on motorcycles.

Finally, AMA believes that this controversial issue should be decided at the state level without any encouragement or coercion from Congress. Given the choice between more highway funds, or less, it becomes obvious which the state will select. In short, the mandatory helmet provisions of H.R. 1782 have no place in the Highway Reauthorization Act.

Highway Safety

AMA supports the continued designation of motorcycle safety as a "national priority," thereby making motorcycle safety programs eligible for federal Section 402 State and Community grant funding. We believe programs which have been funded with Section 402 money have been highly successful in helping reduce the accident and fatality toll from motorcycle related crashes.

There are many innovative programs states can initiate with 402 funds if they continue to be available. Motorist awareness campaigns, special emphasis on licensing and training, and general information about motorcycling should receive adequate federal funding.

National Recreational Trails Fund

The AMA fully supports the provisions of H.R. 1155 and its Senate companion S. 400, the National Recreational Trails Fund Act of 1991.

This legislation represents a unique opportunity for all outdoor recreationists to share in the enjoyment of our public lands. Not only will user fees from the federal gas tax be allocated for motorized trail construction, but a significant portion of the funds collected through the Highway Trust Fund will be dedicated to enhancing and

preserving non-motorized trails as well. This concept, we believe, is consistent with the multiple use policy which has traditionally governed our public lands. Fuel taxes, paid in the form of "use fees" should continue to accrue and be allocated for purposes relevant to those who generate them. H.R. 1155, if approved as part of the reauthorization of federal highways, would allocate gas tax revenues derived from trail related motorized activities to the construction and maintenance of trails rather than pavement. The National Recreational Trails Trust Fund would be established to allocate funds for this purpose. At one half of one percent (.005), of annual Highway Trust Fund receipts, an estimated $75 million would be generated annually. The program would be administered through the Department of Interior in cooperation with state and local government which would ultimately receive and spend the grant money.

AMA believes this to be a legitimate use of Highway Trust Fund tax receipts since off-highway vehicles generate this money. However, not just motorized interests will benefit, but other non-motorized trail users as well.

In today's adverse economic climate, states must look to tourism and recreation to supplant lost revenue from other sectors. This bill will enable states to construct and maintain recreational trails which are traditional sources of tourist attraction.

AMA commends Rep. Petri and Sen. Symms for introducing H.R.1155/S.400 and urges its inclusion in the forthcoming Highway Reauthorization Act.

Scenic Byways

AMA supports the inclusion of a scenic byways program in the Surface Transportation Assistance Act. It is clear from recent research that Americans relish their recreational roads and motorcyclists are no exception. Therefore, as a member of the American Recreation Coalition, AMA also recommends:

- the establishment within FHWA of a permanent office to coordinate state and local scenic byways efforts.
- the creation of a National Scenic and Historic Byways Advisory Commission
- an FHWA administered program to coordinate and assist states in designating and enhancing scenic and historic routes as well as improve the convenient and safe use of these highways and byways
- using federal aid funding to accomplish the above goals.

This program will benefit all motorists, but motorcyclists are particularly well suited to enjoy improved scenic byways.

**Conclusion**

In summary, it is fair to say that no one is more concerned about the future and safety of motorcyclists than AMA. We will continue to stress our agenda at every opportunity, and we are therefore thankful for your attention to our suggestions for the formulation of the reauthorization of the Surface Transportation Assistance Act.

# AMA GOVERNMENT RELATIONS POSITION

AMERICAN MOTORCYCLIST ASSOCIATION

**TOPIC:**

**MANDATORY HELMET LAWS: An Issue Of Individual Choice**

**POSITION:**

The American Motorcyclist Association has always encouraged the use of helmets, gloves, sturdy footwear, and protective garments in general, as part of a comprehensive motorcycle safety program to help reduce injuries and fatalities in the event of a motorcycle accident.

The Association will not oppose laws requiring helmets for minor motorcycle riders and passengers. It believes that many young motorcyclists and passengers may lack the maturity to make an informed decision regarding the use of motorcycle helmets. It is, therefore, appropriate to require the use of safety helmets for minors.

Although the Association strongly encourages helmet use by all motorcyclists, it maintains a long-standing fundamental belief that adults should continue to have the right to voluntarily decide when to wear a helmet.

The Association further believes that helmet use alone is insufficient to ensure a motorcyclist's safety. There is a broad range of other measures that can be implemented to improve the skill of motorcycle operators as well as reduce the frequency of situations where other vehicle operators are the cause of accidents involving motorcycles.

**DISCUSSION:**

The AMA has traditionally supported the right of adults to choose whether to wear a helmet. Our position has remained unchanged since the 1966 inception of mandatory helmet laws across the nation. Even though our members are strongly encouraged to wear helmets, we believe the choice clearly should remain with the individual.

To better understand the Association's position on helmet laws, it is first necessary to make a distinction between the use of helmets and mandatory helmet laws. Some members of society tend to view the helmet only as a mechanical safety device in the same category as seatbelts. What they fail to realize is that it is viewed by motorcyclists as an accessory of personal apparel connected with their chosen lifestyle and their right as adults to make their own decisions. Unlike seatbelts, helmets do not come "standard" with motorcycles and represent a separate purchase. Helmet laws, on the other hand, are a manifestation of society's belief that its members lack the wisdom to make decisions about personal safety and must therefore be subjected to arbitrary laws. This is a concept we must reject.

American Motorcyclist Association, P.O. Box 6114, Westerville, Ohio 43081-6114

Telephone (614) 891-2425
Telefax (614) 891-5012

The injuries from which a helmet may protect a rider do not occur until after an accident. A mandatory helmet law does nothing to prevent an accident from occurring. The AMA has been a strong advocate of motorcycle rider education, improved licensing and testing and increased public awareness; all proven preventative measures that actually reduce accidents and improve safe operation. These statistically viable programs did not exist 20 years ago, and there is some evidence that exclusive focus on helmet laws, while ignoring the benefits of these programs, has been detrimental to the advancement of a comprehensive approach to motorcycle safety.

It is possible that the political realities of the legislative process may actually prevent the implementation of other motorcycle safety initiatives in the presence of mandatory helmet laws. Only nine helmet law states have passed rider education legislation, while 20 "free choice" states have adopted comprehensive rider education programs. For example, only after a decade-long debate on helmet use did Florida finally adopt a rider education program in 1987. Motorcycle rider training bills were continuously postponed while helmet law proposals dominated that legislature's attention.

It is suggested by some that permitting mature adults to make their own decisions on helmet use creates an excessive burden for society as a result of healthcare costs incurred by helmetless riders. However, when the costs of motorcycle related injuries are examined in the context of the total social healthcare picture, the figures are not unusually startling.

According to the National Highway Traffic Safety Administration, Americans spent $4.1 billion on all motor vehicle accident related medical expenses in 1986. This compares with $425 billion for total U.S. healthcare costs (1987 Statistical Abstract of the U.S.*), indicating motor vehicle accidents account for less than 1 percent of our nation's annual healthcare costs. The Motorcycle Industry Council, in its 1988 Motorcycle Statistical Annual, estimates that there are approximately 7.5 million motorcyclists who constitute roughly 4 percent of a total driving population of 180 million licensed drivers. If it is assumed that motorcyclists account for as many as 10 percent of all accident related medical expenses (which could be argued as excessive) then all motorcycle accidents represent less than one-tenth of 1 percent of all medical expenses in a given year. This figure would be further reduced if it were possible to determine what percentage of those expenses were incurred by helmeted vs. non-helmeted riders.

Realistically, motorcyclists are certainly not the only group of persons who might create a social burden as a result of individual decisions. We are a society of risk takers and even by avoiding the "extremes," mountain climbers, bicyclists, skiers, cowboys, and joggers could be placed in a similar category. Despite these "burdens,"

(over)

we don't see aggressive legislative action designed to limit society's exposure to these costs nor would such legislation be appropriate. We have long ago decided as a civilized society to balance individual freedoms with necessary social costs.

The value of a helmet is neither enhanced nor diminished by the presence or absence of a mandatory helmet law. We believe that the same principle applies to mandating personal safety, whether it be for motorcycling, skiing or some other risk-related activity. We must rely on individuals and society to provide the education and the experience to aid us in making decisions that are right for us. Ultimately, society cannot be expected to make individual decisions; we must be free to make them ourselves.

encl: Written testimony on the Proposed Indianapolis to Evansville, Indiana, highway. (3 copies)

Indiana: Proposed Indianapolis to Evansville Highway
Phillip Foster, CARR Testimony April 30, 1991 1

My name is Phillip Foster. I am a resident of Indiana and a representative from an informal organization called Citizens for Appropriate Rural Roads (CARR).

I am here to discuss funding for development and construction of the proposed highway from Indianapolis, Indiana to Evansville, Indiana. It should be noted that the proposed highwa, does not actually begin in Indianapolis, but in fact originates in Bloomington, which is not depicted in Exhibit A.

The following concerns will be addressed:

1. Prior economic feasibility studies have recommended that this highway not be constructed.

and 2. If constructed, it will have a negative impact on many environmental issues.

CARR is opposed to construction of this highway. Based upon the federally funded Donohue Study regarding the highway, there is only about a 13 mile difference between traveling existing 4-lane highways from Evansville to Indianapolis and the proposed route. Using the current estimates, to save that 13 miles between Evansville and Indianapolis will cost taxpayers about one billion dollars.

Proponents of the highway claim there will be great "economic benefit to Southwestern Indiana". However, it should be noted that none of the independent studies completed have recommended the building of this highway. The Donahue Study states in part that "Based on the results of the cost and benefit evaluation, construction is not recommended for any of the three proposed routes". (Exhibit B)

encl (1)

Also, according to a U.S. Department of Transportation letter, the Federal Highway Administration submitted a report to Congress in July 1990 concluding that, "Based on an analysis of direct highway benefits and the likely indirect benefits of economic development, the proposed highway is at best marginal from a cost effectiveness standpoint." (Exhibit C)

In March of this year, Jim Newland, transportation advisor to Governor Bayh, stated that "the infrastructure of this country is in trouble. It's old, inadequate and worn out. That it may be difficult to make a case for new highway construction". Mr. Newland also noted that there have been 7 feasibility studies (on this highway) and "these studies indicate that the project cannot be justified from an economic standpoint". (Exhibit D)

The proposed highway route is being studied in 3 segments. The total required funding and a complete environmental study will not be provided for the entire route before commencing construction. Only one segment at a time will be fully studied and funded. What happens if the last two segments are found to have an unacceptable environmental impact and/or the additional funds are not appropriated? Then we could end up with a super highway from Bloomington to Newberry. Newberry's population is approximately 200 people.

The two most serious environmental problems in the country, according to Environmental Scientists, are Habitat destruction and forest fragmentation. The Donohue Study states: Of all the proposed alternatives, one of the most environmentally sensitive

areas occurs on the corridor between Bloomington and Newberry. The combined presence of forest, unique geological features, and threatened and endangered species heighten the sensitivity of this area to potential damage.

The corridor from Newberry to Evansville is one of the areas that holds the greatest potential for impact to agricultural land.

Approximately 4,000 acres of wetlands occur along the proposed corridor from Newberry to I-64. Potential impacts to these wetland areas include changes in water quality and drainage. The U.S. Fish and Wildlife Service is starting its fourth year of restoring drained wetlands in Indiana. Indiana's wetlands have been reduced by drainage and development such that now only a little over 10% of the original area remains. (Exhibit E)

Now only 19 % of Indiana's original forested ground remains and that is primarily concentrated in Southwestern Indiana. The corridor from Bloomington to Newberry would severely impact our remaining forested land. (Exhibit F)

The Karst topography that occurs in Southwestern Indiana is considered to be of global significance. Several private environmental groups as well as state and federal agencies have worked for years to protect this region. The corridor between Bloomington and Newberry would cross significant stretches of the Karst topography including caves, springs, and sinkholes. (Exhibit G)

According to the Donahue Study, the majority of protected species listed by the Indiana Division of Nature Preserves and the Department of Natural Resources as potentially impacted by the proposed highway occur throughout the entire route.

CARR requests that no funds be appropriated for the engineering design of the Bloomington to Newberry segment and no funds be appropriated to do additional studies, as all previous studies have recommended that this highway not be built.

Under no condition should any design monies be allocated until an Environmental Impact Statement has been completed for the entire route.

## Conclusions

In conclusion, none of the routes analyzed in this study are recommended for construction solely on an economic feasibility basis. This recommendation is based on the following:

- Low benefit/cost ratios were found for the range of alternative assumptions used in the sensitivity analysis, considered as a whole. Given these results, it is inappropriate to focus solely on the ratio resulting from the most optimistic set of assumptions, when under several other sets of assumptions the ratio is well below 1.00.

  There is inherent uncertainty in any long-range economic forecasting process. The benefit/cost ratios developed in this study include employment and income benefits based on such forecasts. It is difficult to establish a specific benefit/cost ratio which determines economic feasibility. However, Cambridge Systematics' experience in other states has shown that projects with benefit/cost ratios in excess of 1.5 have been given priority funding. While this ratio has not been sanctioned officially by any state or organization, it has been found in our experience to represent a reasonable lower bound for project selection.

  Funding would require creation of a multi-county authority and commitment of considerable local dollars for a long time period. This would assume that the highway is the highest priority for each of the counties along the route and that each county government is willing to devote significant revenue sources to the project for about 30 years. There is no such precedent of this type in the area. If undertaken, this project would be the most costly highway built in the State of Indiana since development of the interstate system.

## Recommendations

**Based on the results of the benefit/cost evaluation, construction was not recommended for any of the four alternatives.** While the A/Freeway alternative does have a benefit/cost ratio greater than one under certain assumptions, it does not merit recommendation for construction given the magnitude of the ratio and the uncertainty involved in long-range economic analyses. Economic evaluations for many highway projects in other states have resulted in benefit/cost ratios ranging from 1.5 to 5.0. This suggests that there may be other projects both inside and outside Southwest Indiana that would represent better investments.

The five small segments within the three study corridors with potential to provide economic and transportation benefits to the region should be considered for further study.

Mr. Thomas R. Tokarski
Member, Citizens for
Appropriate Rural Roads
P.O. Box 54
Stanford, Indiana 47463

Dear Mr. Tokarski:

Thank you for your February 15 letter to Secretary of Transportation Samuel K. Skinner concerning the proposed Indianapolis-to-Evansville highway. You explained your reasons for objecting to the proposal. We have been asked to answer your letter.

We are aware of the feasibility studies you mentioned. At the request of Congress, we conducted the most recent one, which you referred to as the Donohue Study. We worked with the Indiana Department of Transportation (IDOT) to evaluate the feasibility of the route and the potential economic, industrial, recreational, and community development benefits that might result. We submitted our report to Congress on July 19, 1990, concluding that, **"Based on [an] analysis of direct highway benefits and the likely indirect benefits of economic development, the proposed highway is at best marginal from a cost-effectiveness standpoint."**

We do not select projects, or tell the States which projects to fund. Instead, we make Federal-aid highway funds available to the State highway agencies each year by statutory formula to help in their highway construction and improvement programs. State highway officials are responsible for project selection and development within funding limits. The IDOT, therefore, has the sole authority to select projects for use of formula Federal-aid highway funds. Our role, when the IDOT decides to use Federal-aid funds, is to review the State's work to make sure it meets Federal requirements and supports the State's decision on the best alternative for each project.

The IDOT initiated preliminary studies of the proposed highway, which will be conducted in accordance with Federal requirements. The many environmental and related laws, regulations, and policies will be followed, including the National Environmental Policy Act of 1969. It requires preparation of an environmental impact statement when a federally assisted undertaking will cause significant impacts. The FHWA will provide technical assistance and grants approvals at key stages of project development.

EXHIBIT C
(cont.)

The IDOT chose consultants to study the route in three phases (Bloomington to Newberry, Newberry to Petersburg, and Petersburg to I-64). The consultants are planning multiple opportunities for public involvement. An initial informational meeting on December 10, 1990, attracted about 300 people. More recently, public information meetings were held on March 6 in Washington and on March 7 in Evansville.

I suggest that Citizens for Appropriate Rural Roads express its concerns to the IDOT and participate in the public involvement process. That way, you can be certain your views, and those of the organization will be heard. You will also have the opportunity to review and comment on the material released by the IDOT during the environmental review stage. The IDOT's address is State Office Building, Room 1101, 100 North Senate Avenue, Indianapolis, Indiana 46204. I cannot predict the outcome, but I can assure you that your concerns, and those of others who comment, will be considered.

I appreciate your taking the time to let us know your views on the proposed highway project. I will provide a copy of this correspondence to our Division Administrator in Indianapolis, Mr. Arthur A. Fendrick, so he will be aware of your concerns. He will provide a copy to IDOT officials as well.

Sincerely yours,

Eugene W. Cleckley, Chief
Environmental Operations Division

EXHIBIT D

# Newland says highway opponents being heard

Jim Newland, transportation advisor to Governor Evan Bayh, said communities, businesses, and individuals who favor construction of a new Evansville-to-Indianapolis highway may lose out early in the process unless they become more vocal.

Newland, speaking to the Odon Business and Professional Association at their dinner meeting last week, said this project will be competing with other infrastructure needs for the available federal dollars and suggested that the support of the entire Indiana Congressional delegation will be needed to fund the project.

Newland said "We must recognize the fact that the infrastructure of this country is in trouble. It's old, inadequate and worn out. It may be difficult to make a case for new highway construction." Newland told the business group that Congressman Lee Hamilton favors the new north-south route but recently noted that the comments he is hearing are generally negative.

"Construction of this road would have a disruptive effect on many in its path and we are also hearing objections from environmental groups, particularly from the Bloomington area" he said. "I'm afraid those who favor the project are not exerting the kind of influence necessary to get the job done."

Mr. Newland, a native of Daviess County, said the Hudson Institute, an Indianapolis-based study organization, feels that the economy of Southern Indiana will "explode significantly" if the highway is built. But he also noted that there have been at least seven feasibility studies and these reports indicate that the project cannot be justified from an economic standpoint. "The federal government pays the bill and sets strict guidelines. These guidelines require proof that the project can be justified by economic growth."

Mr. Newland said individuals, businesses and communities who support the new highway should organize to present the positive aspects of the proposal to Indiana's congressmen and senators.

ODON JOURNAL, ODON INDIANA, 18 March 1991

EXHIBIT E

## Wetlands serve valuable purposes

# Wetlands program in its 4th year

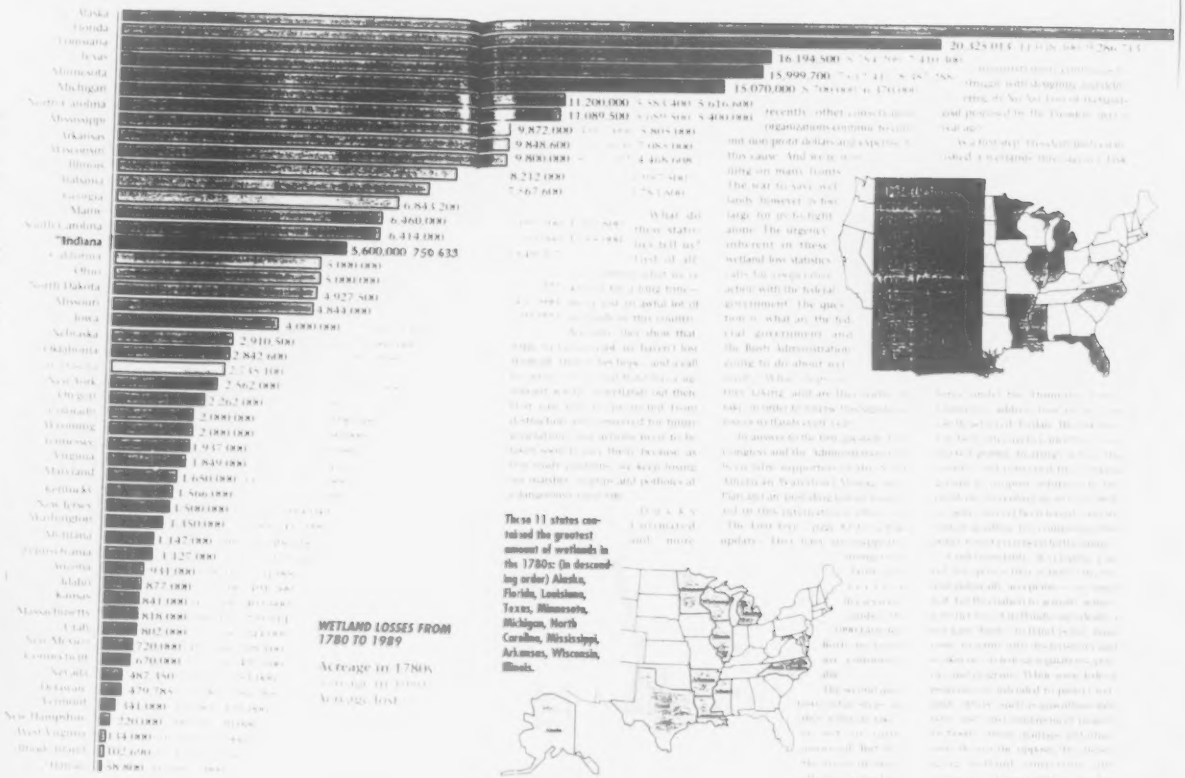
The U.S. Fish and Wildlife Service is starting its fourth year of restoring drained wetlands in Indiana. Through the Service's Wetland Restoration Program, wetlands that have been drained in the past can be restored to attractive and productive wildlife habitat at no cost to the landowner. Most sites that have been drained by a tile or a ditch, and that the landowner wants to restore to wetland, will qualify for the program. The restoration usually involves placing a water control structure on a drainage tile or constructing a small dam in a drainage ditch. The U.S. Fish and Wildlife Service funds 100 percent of the restoration cost, and, in return, the landowner must agree to protect the wetland for a minimum of 10 years.

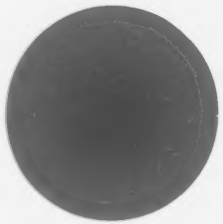
Indiana's wetland resources, once totalling over 5½ million acres, have been reduced by drainage and development to such an extent that only 750,000 acres remain. Drained wetlands, however, can be restored. Restoration of these areas, now often marginal as farmland, will play an important role in improving the quality of the natural environment in Indiana. Wetlands are valuable in controlling flooding, recharging groundwater, purifying ground and surface waters, and providing wildlife habitat.

The Wetland Restoration Program has restored 7,000 wetlands across the midwest and over 300 wetlands in Indiana. Those who would like to find out more about this program can contact the U.S. Fish and Wildlife Service at 718 North Walnut Street, Bloomington, IN 47404, telephone (812) 334-4261.

# CONSERVATION

## A GRAPHIC LOSS





**WETLAND LOSSES FROM 1780 TO 1989**

Acreage in 1780s

Acreage lost

These 11 states contained the greatest amount of wetlands in the 1780s: (in descending order) Alaska, Florida, Louisiana, Texas, Minnesota, Michigan, North Carolina, Mississippi, Arkansas, Wisconsin, Illinois.

their role in maintaining water quantity and quality as well as the opportunities they provide for environmental education and recreation. Many existing and proposed nature preserves and wildlife refuges occur in the vicinity of river crossings of all three alignments including Buckskin and Elberfield Bottoms and the proposed Patoka National Wildlife Refuge in Corridor A. The Fish and Wildlife Service was consulted for their alignment preference through the proposed Patoka National Wildlife Refuge along Alternative A. Hunley Creek Bottoms, Huntington Lake, and Buffalo Flat occur near Corridor B, although the corridor shown for this report would avoid these areas. The Lost River watershed along Corridor C has been proposed as a National Monument by various scientific and public groups and is under study for nomination.

Other wetland types sensitive to highway impacts include the numerous sinkhole ponds associated with karst features along Corridors AB and C and coal ponds along Corridors A and B. Potential impacts to these wetland types such as change in water quality and drainage would also require evaluation in the EIS phase and will be more thoroughly addressed in the Unique Geology and Mineral Resource sections later in this chapter.

Both Corridors A and B include over a dozen river and stream crossings (Table 12.2) where bridge construction and replacement could cause damage to water quality and wetland habitat, and protected species. The state and federally endangered Bald Eagle has been sighted along the Patoka and White Rivers in the vicinity of highway crossings. Mussel beds and the rare fish, the Eastern Sand Darter may also occur in the White River crossings of both Corridors A and B.

**Forested Lands**

In pre-settlement times, Indiana was covered by 85 percent forest. The 19 percent that remains today is primarily concentrated in Southwest Indiana. Corridors C and AB would be most impacted by forest removal. It is estimated that highway construction on new terrain through these routes could remove respectively about 450 and 400 acres of forest land with associated impacts to the timber industry and plant and animal habitat (Table 12.2). Impacts to the timber industry include destruction of public and private managed forest, reduction in the quality of contiguous timber stands by highway fragmentation, and potential damage or destruction of trees caused by highway runoff and changes in drainage patterns.

The impact of forest fragmentation on plant and animal habitat represents another serious environmental concern. Remaining forest land in Southwest Indiana provides refuge to over 30 species of threatened and endangered plants and animals, many of which require large unbroken tracts of forest for their survival. Highway construction could destroy or degrade critical habitat, interfere with animal movements, and potentially impact dozens of species on the borderline of becoming threatened or endangered should any significant reduction of their habitat occur. Included among these are over twenty species of warblers that nest in forest interiors. The reproductive potential of these birds may be

and if distrubed could impact wells, ponds, lakes and streams by acid and toxic runoff. Such potential impacts to water quality would require evaluation in the EIS prior to highway construction.

Coal maps provided by the U.S.G.S. are included in the materials accompanying this final report for use in the detailed highway design through these areas. The wetlands inventory maps (mentioned in the Wetlands section of this chapter) are also useful in identifying coal ponds.

Limestone is another important mineral resource in this area. Salem limestone is quarried from areas in the AB and C Corridors. It is possible that new roadway construction in these corridors could impact this resource.

Unique Geological Features

The term karst topography refers to landscape features which form as a result of the subsurface diversion and solution of surface water to underground routes where they erode and dissolve the bedrock into unique geological features such as caves, sinkholes, underground springs, rising and disappearing rivers.

Karst topography occurs along approximately 2,000 square miles of Mississippian limestone outcrop in Southwest Indiana (Figure 1.2) and is considered to be of global significance by geologists as a classic example of well developed karst features. Several environmental groups have worked to protect this region over the years including the Indiana Karst Conservancy, the Lost River Conservation Task Force, the Nature Conservancy, the Hoosier Environmental Council as well as state and federal agencies.

Significant stretches of each of the alternatives occur on karst topography on new alignment. National landmarks, nature preserves, numerous caves and other karst features, and unique habitat for rare species occur particularily within the corridor of Alternatives AB and C.

The biology of the karst region is also unusual, as the subterranean environment provides habitat for a variety of specialized species such as albino fish and crustaceans. Many of these are state and/or federally listed threatened or endangered species, such as the northern cavefish (Amblyopsis spelaea). In addition, caves provide reproductive and wintering habitat for three protected species of bats including the state and federally endangered Indiana bat (Myotis sodalis).

Of particular interest within Corridor C is the Lost River watershed which has been proposed as a National Monument by the Lost River Conservation Task Force of the National Speleological Society and currently is under study by the National Forest Service for nomination into the National Wild and Scenic Rivers program. This region occupies approximately 355 square miles in sections of Dubois, Lawrence, Orange, Martin, and Washington Counties. The Lost River flows as a conventional river for nearly three-fourths of its 78-mile course, then disappears underground leaving a dry river bed from which flood waters often resurge unpredictably.

Exhibit G (cont.)

## CAVERNS AND SINKS

Limestone caverns show what ground water can do in its age-long task of dissolving rock underground. Take Mammoth Cave, in Kentucky, as an example.

Some 225 to 275 million years ago, an arm of the Gulf of Mexico gradually reached up through what is now the central United States. For perhaps 30 million years it stayed there. Then the land was uplifted and the sea retreated, leaving a deposit of limestone covering thousands of square miles. This rock, reaching a maximum thickness of 1,200 feet in Kentucky, had formed from minerals in the sea water and from the limy remains of untold trillions of tiny sea plants and animals.

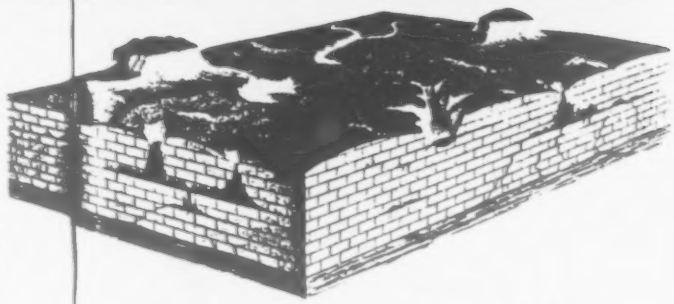
As the sea withdrew, rains filled the limestone strata with fresh water. Through cracks and crannies in the rock water kept flowing. Oxygen and carbon dioxide, picked up by the water from air and from plants, helped the water to dissolve the mineral calcium carbonate out of the limestone. (Limestone is mainly calcium carbonate.) Slowly the water made larger and larger channels, and some of these eventually became large caverns. Roofs of the deeper cavities collapsed, because of the weight of the overlying rock, but numerous caverns near the surface remained intact.

Mammoth Cave is one of the largest networks of caverns so far discovered. Today, because the water table has fallen, we can explore the upper cavities. Those farther down are still under water.

In caverns above the water table we find stalactites and stalagmites. In a process that takes thousands of years for the big ones, these odd structures are built by water oozing from cave ceilings and dropping to the floor.

As water emerges from a ceiling, some of the carbon dioxide in it escapes. Since it is this gas that has enabled the water to keep calcium carbonate in solution, the water on emerging deposits a little of the mineral. Continuing deposition at an opening may form a stalactite.

Ordinarily a stalactite starts as a ring around an opening and grows as a tube. Eventually the tube becomes blocked, but growth of the stalactite may continue as water trickles down



**Limestone country**—Where the bedrock is of limestone and stands high above surrounding land, water drains down rapidly through the rock, dissolving it to form sinkholes, caverns, and other features.

over the outside. Most very large stalactites—those many feet long—probably take tens or hundreds of thousands of years to build.

Stalagmites are formed by water that falls to the cave floor. Here calcium carbonate builds upward in piles that suggest "reverse" stalactites. Where a stalactite and a stalagmite meet, a column or pillar is formed.

Ground water has been dissolving away the thick limestone of Kentucky and southern Indiana at the rate of a foot of elevation each 2,000 years. Beneath the land surface are millions of miles of channels, large and small, and the countryside is dotted with "sinks." These are hollows formed where roofs of caves have collapsed or where surface streams plunge down into underground channels. The large, permanent streams that go underground are called lost rivers.

The modern sport of "spelunking," or exploring limestone caverns, has become highly popular. Systems of water-made tunnels, some of them miles long, are a challenge to the ingenious and the daring. Water-filled channels are sometimes explored by swimmers with artificial breathing devices. Spelunking demands special equipment and great skill, and is safe only in groups with experienced leaders.

HIGH SPEED RAIL ASSOCIATION

STATEMENT OF

ROBERT K. PATTISON

CHAIRMAN

HIGH SPEED RAIL ASSOCIATION

BEFORE THE

SUBCOMMITTEE ON SURFACE TRANSPORTATION

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

UNITED STATES HOUSE OF REPRESENTATIVES

WASHINGTON, D. C.

APRIL 18, 1991

*206 Valley Court, Suite 800, Pittsburgh, PA 15237-2047 (412) 364-9306*

STATEMENT OF ROBERT K. PATTISON

BEFORE THE

HOUSE SUBCOMMITTEE ON SURFACE TRANSPORTATION

Mr. Chairman and Members of this distinguished Subcommittee, on behalf of the High Speed Rail Association (HSRA) and HSRA's Right-of-Way Task Force, thank you for the opportunity to submit this statement. My name is Robert K. Pattison, and I am Technical Director-Railroads for the engineering firm of Parsons Brinckerhoff Quade & Douglas, Inc. I also serve as chairman of HSRA.

HSRA does not seek funding authorization from the Subcommittee for any particular project, though I personally know of many which would be worthy. HSRA instead urges the Subcommittee to authorize the States to allow, at their option and where safety permits, access to Interstate highway rights-of-way for high speed rail systems (including steel-wheel and magnetic levitation technologies) at a value to be determined by the States. HSRA also urges that adjustments to accommodate these public and privately owned systems, while protecting the safety and integrity of the highway corridor, be considered eligible for Federal-aid highway expenditures.

Mr. Chairman, the Administration's Surface Transportation Assistance Act (STAA) contains all of these provisions. H.R. 1351 provides for the States to choose whether to permit high speed rail access to the Interstate system, and under what conditions. In our view, increased regional

flexibility, provided that high speed access meets requisite Federal safety standards, is the key. Current law already permits access to the Interstate corridor by "rail or nonhighway public mass transit facilities," but requires the States to charge fair market value for the airspace rights unless the system is publicly owned.

Under the Administration's proposed surface transportation reauthorization, States could determine the cost of Interstate access to the high speed system operator, charging less than fair market value, a specified percentage of future high speed system revenues, or no charge at all. The STAA would also make eligible for Federal funding safety-related adjustments to the highway facility necessary to accommodate high speed systems. While HSRA has reservations concerning portions of H.R. 1351, it provides a foundation for the Subcommittee's review in considering State flexibility to authorize Interstate corridor access by public or privately owned high speed rail systems.

Such access, particularly at less than fair market value as determined by the States, will provide a powerful incentive to the private sector to accelerate the implementation of high speed rail technologies across the United States. While in many cases Interstate access may not be appropriate, in other areas lower-cost use of the Interstate corridor for discrete portions of the right-of-way will enable construction of high speed systems not otherwise possible due to the anticipated capital costs of $2 billion to $5 billion for any of the under-500 mile projects now under discussion.

With few exceptions, these sums are beyond the resources of the States and the private sector alone; cost-effective Federal leadership is necessary. By granting permissive access to the Interstate highway corridor for high speed rail projects at a value to be determined by the States, the Federal government can help forge the new public/private partnerships necessary to meet the Nation's mobility demands for the 21st century. HSRA urges the Subcommittee to include in this year's surface transportation reauthorization legislation specific provisions authorizing, where safety permits and at State option and valuation, access to Interstate rights-of-way by privately owned high speed rail system operators as well as public entities.

Encouraging High Speed Rail is in the National Interest

HSRA, founded in 1983, is the only organization devoted exclusively to advancing high speed rail, including advanced steel-wheel trains of all types as well as magnetic levitation technologies. HSRA is an "umbrella group" with broad support -- much more diverse than typically found in a trade group. A wide variety of interests are active in our Association, including the engineering and design professions; railway suppliers; construction firms; aerospace companies; universities; U.S. maglev experts and foreign maglev manufacturers; labor unions; transit operators; overseas and domestic railroads; real estate development firms; service providers and professionals; academia; the investment community; electric utilities and utility suppliers; and national, state and local agency officials.

HSRA now has more than 850 members and has gained international recognition as the preeminent organization representing those seeking to advance the implementation of high speed ground transportation in the United States. HSRA officers or directors have testified before numerous committees of the Congress, and we work closely with the Executive Branch, including the Department of Transportation, the U.S. Army Corps of Engineers, and the Department of Energy. Our Right-of-Way Task Force is composed of members of HSRA with a specific, immediate interest in this issue.

HSRA supports implementation of high speed rail technologies in the United States and around the world for the safe and speedy transportation of passengers over distances of 100 to 600 miles. High speed rail is energy-efficient and environmentally sensitive. It is a technology with great promise, because every indication is that travel demand in the United will continue to grow in future years. Unless we take measures now to increase our transportation capacity, both our highway and air modes will become increasingly congested.

Mr. Chairman, you know that the U.S. Department of Transportation's National Transportation Policy, released in March 1990, states that highway travel delays in urban areas now total more than two billion hours annually. A report by the American Association of State Highway and Transportation Officials (AASHTO) said that U.S. urban freeway delay could increase more than 400 percent by the year 2005. AASHTO also reports that surface travel demand is expected to at least double by the year 2020. The

Federal Highway Administration estimates that vehicle delays due to freeway congestion will increase 400 percent in urban areas from 1985 to 2005.

The situation in our skies is just as crowded. According to the Federal Aviation Administration, 21 primary airports each now experience more than 20,000 hours of annual flight delays at a yearly cost to airlines and U.S. businesses of at least $5 billion; by 1997, 33 airports are forecast to exceed this level of delay.

Clearly, we must encourage new solutions in transportation. High speed rail offers a safe, environmentally-sensitive, and energy-efficient alternative. Let me briefly describe these attributes:

* <u>High speed rail is safe.</u>

High speed rail is the safest form of transportation in existence today. Japanese Bullet trains have never had a passenger fatality in 26 years of operations although the trains have carried over 3 billion passengers. Both the French TGV, in nine years of operations in France, and the German ICE trains also have perfect passenger safety records.

In contrast, since the first automobile accident at the turn of the century, more than 2.5 million Americans have died on our highways. The safety risks of flying commercial air carriers are also well known. High speed rail offers a proven, safe transportation alternative.

° High speed rail is environmentally sensitive.

A shift in travel to electrically powered trains will assist in a cleaner atmosphere. The reason is that highway vehicles emit significant amounts of the primary components of air pollution: carbon monoxide (CO), hydrocarbons (HC) and nitrogen oxides (NOX). Electric utilities which power electrified high speed trains such as the TGV and the ICE emit far lesser quantities of these pollutants. Although utilities powering high speed rail systems may emit greater quanties of sulfur oxides (SOX), these utility SOX emissions are site-specific and more easily controlled.

High speed rail also conserves land compared with other modes, particularly if Interstate right-of-way access is encouraged. Two tracks of a high-speed system can potentially carry as many travelers as 10 lanes of an Interstate highway. It should also be noted that the entire Paris-to-Lyon TGV system uses less land than the de Gaulle Airport near Paris, according to the Executive Summary of the Pennsylvania High Speed Intercity Rail Passenger Commission final report.

° High speed rail is energy-efficient.

New high speed rail systems between major metropolitan centers -- Houston-Dallas; Chicago-Detroit; Philadelphia-Pittsburgh; Orlando-Miami, and others -- would permit our airlines to perform the function they carry out most effectively: carrying large numbers of people long distances. Short airline trips of under 500 miles are costly and fuel-inefficient, and clog the

limited takeoff and landing slots available at each airport. The Argonne National Laboratory has estimated, for example, that flights of up to 600 miles account for 45 percent of all energy consumed by commercial aircraft, and that for commercial aircraft trip lengths of roughly 400 miles, approximately 72 percent of the total energy required is consumed in inefficient operations such as taxiing on the ground and in low-altitude flight. High speed rail systems would enable the Nation's airspace capacity to be reserved for the longer-distance, more efficient (and more profitable to the airlines) flights of over 600 miles for which there is no ready alternative.

Institution of electrified high-speed trains would contribute greatly to any national effort to reduce consumption of imported oil. It also should be noted that the National Energy Strategy issued by the Bush Administration in February 1991 proclaims the following as a "major initiative": "The Department of Transportation, the Department of Energy, and the Corps of Engineers will pursue high-speed rail technologies and the National Maglev Initiative to explore alternatives for both long-distance automobile travel and short-haul air travel."

## Interest in High Speed Rail As a Complementary Transportation Mode is Accelerating

In part because of these and other advantages, interest around the country in planning for the construction of high-speed train lines has grown rapidly. States which have established dedicated commissions or authorities to evaluate high speed proposals include Florida, Texas, Ohio, Pennsylvania, California

and Nevada. State Departments of Transportation in California, Washington, Minnesota, Wisconsin, Illinois, Indiana, New York and Massachusetts are initiating new studies regarding high-speed rail or in some instances improving track to facilitate higher Amtrak speeds. Aviation commissioners in Massachusetts and Arizona are interested in high-speed rail, as is the highway commissioner of Georgia, the Governor of Virginia, state legislators in Colorado and Pennsylvania, the mayor of St. Louis, and planners and researchers in the Federal Railroad Administration, Argonne National Laboratory, Department of Energy, U.S. Army Corps of Engineers, Environmental Protection Agency, and several Committees of Congress.

The Federal Government's position with respect to high speed rail has evolved significantly in just the past two years. The Administration's proposed budget for FY 1992 includes $15.5 million for high speed rail programs (including the National Maglev Initiative) under the authority of FRA, in addition to a proposed $8 million for similar activities under the auspices of the U.S. Army Corps of Engineers. This Subcommittee heard testimony on high speed rail development just a year ago, and already half-a-dozen bills advancing high speed ground transportation have been introduced in the 102nd Congress. HSRA is committed to working with Congress and the Executive Branch to make implementation of high speed rail (including maglev) a national imperative.

Yet, despite the tremendous promise, rapidly growing interest, and clear public benefit, as a Nation we have not yet

advanced to ground-breaking for any of the proposed high speed projects across the country. The main obstacle is financial -- overcoming the capital costs in the range of $2 billion to $5 billion for any of the under-500 mile corridor projects now under discussion. For all but a few of the most attractive proposals, States and the private sector cannot amass the capital resources required to begin implementation of these systems.

High speed rail system access to Interstate highway right-of-ways at less than fair market value offers significant potential cost reductions in a number of corridors. Such access, at State option and where safety permits, could spur new private sector investment in these publicly beneficial systems and should be encouraged.

**The Committee Should Build on the High Speed Access Provisions in the Administration's STAA Legislation**

Under current law, 23 U.S.C § 142(g) provides that where sufficient land exists within publicly acquired rights-of-way of any Federal-aid highway to accomodate rail or nonhighway public mass transit facilities, and where such use can be accomplished without impairing automobile safety or future highway improvements, FHWA may authorize a State to make such lands available to a publicly owned mass transit authority without charge. 23 U.S.C § 156 applies where the subject services are operated by an entity other than a public authority, and requires that fair market value must be charged for the sale, use, or lease of right-of-way airspace. The statute contains a narrow exception

for social, environmental, and economic mitigation purposes, but this exception does not apply where mitigation efforts are for projects utilizing airspace after a highway has been built.

The Administration's STAA proposal would amend current law to permit the States flexibility in determining the financial conditions imposed for high speed rail system access to the Interstate corrdor. Relevant provisions of the bill include:

Section 106(d):

> Activities eligible for funding include . . . (4) modifications to existing facilities necessary to accommodate other modes: Provided, That modifications may not adversely impact the highway use of the facility . . . .

Section 306(d):

> . . . States may permit a governmental use, use by public or private entities for high speed rail (including magnetic levitation systems) and other transit or utility use and occupancy, or for transportation projects eligible for assistance under this title without charge.

Section 313(j):

> In any case where sufficient land exists within the publicly acquired rights-of-way of the National Highway System to accommodate needed rail, including high speed ground transportation and magnetic levitation systems . . . and where the accommodation can be accomplished without impairing automotive safety or future highway improvements, the Secretary may authorize a State to make those lands and rights-of-way available without charge to a publicly or privately owned mass transit authority or company for those purposes wherever the public interest will be served.

These provisions form the basis for a far-sighted surface transportation policy which would permit States to authorize Interstate highway right-of-way access for whatever use is most beneficial. The policy is permissive -- States can choose

whether to grant such access to private operators at less than fair market value, or for a specified percentage of future high speed system revenues, or for no charge at all. In line with this decentralized control, HRSA recommends that the language in Section 313(j) be changed to require that the Secretary "shall" grant access (instead of "may") where conditions for that access have been met.

HSRA also urges that the Committee carefully consider the implications of requiring, as one of those conditions, that high speed rail access not impair "future highway improvements." Each State should be able to choose the future best use of its Interstate highway corridor resources, whether it be construction of HOV lanes, bus lanes, addition of mass transit systems, additional highway lanes -- or high speed rail systems. Placing a narrow definition of "highway improvements" may hamper long-term optimal use of the Interstate highway corridor, and HSRA recommends that this condition be deleted from the final legislation.

The condition of safe access, however, is critical. HSRA recognizes that high speed rail use of Interstate highway right-of-way must be compatible both with the safety of the highway users and high speed passengers. The issues to be resolved are many, including the impact on the clear zone, interchange interface, visibility impairment, "startle effect" of high speed vehicle approaching or passing, accessibility for construction, maintenance, and emergency egress, noise, and other factors.

As a first step toward answering these and other questions, the Federal Railroad Administration has chartered a task force to examine the safety implications of multi-modal use of highway corridors. Along with engineering investigation by industry, this report and other analysis by FRA and FHWA will help guide the standards for mixed-mode facility use.

In many Interstate corridors, of course, high speed rail access will be incompatible with highway safety. The right-of-way may be too narrow, or the curvature too restricted, to permit such access. But in other areas and parts of the Interstate system, such access may be consistent with safety and entirely feasible. If so, the States should be permitted to choose, as a matter of public policy, whether and under what conditions to permit high speed rail systems to make use of our Interstate corridors.

Although the question of safety is paramount, it need not be addressed now. At such time as high speed rail Interstate access is actually proposed, the Secretary can determine the appropriate standards of safety. Each high speed technology is different (particularly as between maglev and advanced wheel-on-rail trains), and each future application will likely make use of the Interstate corridor in a different manner. If Interstate access is authorized now under specific conditions to be determined later, high speed planners will have an incentive to invest further in system engineering and design. HSRA urges the Subcommittee to provide this incentive by incorporating the concept of high speed rail Interstate access into its surface transportation reauthorization legislation.

## Conclusion

As I have briefly described in my testimony, high speed rail offers numerous public benefits. Yet, the capital costs for numerous high speed projects proposed to date have posed a major obstacle to rapid implementation of this vital technology. Interstate highway corridor access by private sector high speed entities, where safety permits and at State option and valuation, would spur additional investment in our Nation's needed future transportation capacity. HSRA respectfully urges the Subcommittee to build upon the Administration's high speed access provisions as outlined above, and to provide for Federal funding of adjustments to the highway corridor necessary safely to accommodate such access.

Thank you for the opportunity to submit this statement. I would be pleased to respond to questions or inquiries you may have.

INSTITUTE OF TRANSPORTATION ENGINEERS

Friday, April 19, 1991

The Honorable Norman Y. Mineta
United States House of Representatives
Washington, DC 20515

Dear Mr. Chairman:

Attached is the Institute's written statement regarding the Surface Transportation Assistance Act of 1991.

The Institute regrets not having the opportunity to testify before the Subcommittee on Surface Transportation. The written comments express our views on many of the issues that face the Subcommittee in determining the future federal role in surface transportation.

The Institute urges the Subcommittee to complete deliberation and the enactment of legislation prior to September 30, 1991. We offer to expand our position statement and work with the staff towards this goal.

The mobility, transportation safety and our nation's economic vitality depend on achieving this objective.

Sincerely,

Thomas W. Brahms
Executive Director

# Written Statement of the Institute of Transportation Engineers Regarding the Surface Transportation Assistance Act of 1991

*Submitted to the*
*Subcommittee on Surface Transportation,*
*U.S. House of Representatives*

*April 19, 1991*

Founded in 1930, the Institute of Transportation Engineers (ITE) is an individual membership educational and scientific international association of more than 11,000 transportation engineers and planners responsible for the safe and efficient movement of people and goods on streets, highways, and transit systems. ITE members are engaged in planning, designing, operating, managing, and maintaining surface transportation systems in 70 countries. For over 60 years, the Institute has been providing transportation professionals with programs and resources to help them meet those responsibilities. Institute programs and resources include professional development seminars, technical reports, a monthly journal, local, regional, and international meetings, and other forums for the exchange of opinion, ideas, techniques, and research.

Institute of Transportation Engineers

## Introduction

The Institute of Transportation Engineers thanks the House Surface Transportation Subcommittee for the opportunity to express its views regarding the proposed Surface Transportation Assistance Act of 1991.

The Institute congratulates the Department of Transportation for taking the lead in developing and delivering to Congress the proposed Surface Transportation Assistance Act of 1991. *H.R. 1351 represents a positive step towards meeting this nation's future transportation needs. The Institute encourages the Subcommittee to continue your work towards the timely enactment of a Surface Transportation Assistance Act, prior to the current act's expiration on September 30, 1991.*

The provisions of this legislation are critical to the well-being of our nation's future transportation needs. Transportation is vital to the economy and, for that matter, to the quality of life of all Americans. The ability of the United States to compete in the global market is closely tied to the efficiency and quality of our transportation system. Congress can send an important message to America's businesses, to the American people, and to the international community by enacting in a timely manner a multi-year bill.

*The Institute agrees with the general provisions brought forward by the Administration's bill.* We realize that there are differing viewpoints on several items in the Administration's bill on which a consensus must be reached, but *the magnitude of the need and the importance of the funding in transportation programs are too great to delay passage of this bill.*

With construction of the Interstate System essentially complete, this bill will lay the groundwork for addressing the transportation needs of the future. It must provide not only adequate, but also continuing, resources to stimulate state and local government participation in transportation programs and to maximize and facilitate private-sector participation.

Following is a brief overview of what the Institute feels are the most important mobility and transportation safety challenges facing the United States in the post–Interstate System era.

## Mobility

Traffic volume has almost tripled since 1956, the year the Interstate System was begun, and continues to grow at an astounding two to three percent a year. This steady traffic demand has far outstripped the nation's investment in increased transportation capacity. The time we now spend delayed in traffic is being measured in billions of hours each year, time that could be more productively spent elsewhere. With 75 percent of our population now living in urban and suburban areas, traffic congestion is directly affecting most of us in our everyday travel, and it is affecting all of us by lessening the air quality, wasting fuel, and dampening economic growth. That in combination with the deteriorating condition of state/local rural roads and bridges vital to the important agribusiness interest of our nation makes it clear that America is facing a mobility crisis.

As our highway infrastructure decays and traffic congestion worsens, capital investment in the system has fallen short of need in high-growth urban and suburban areas. Suburban growth accounts for 86 percent of the total population growth since 1950. Clearly, the character of commuting demand has been changing, due in part to the migration of jobs to the suburbs.

*Effective congestion reduction during the remainder of the century will require physically increasing the transportation system capacity, efforts to reduce and manage demand, and coordinated interjurisdictional efforts to operate and efficiently manage the existing and expanded transportation system. H.R. 1351 provides a framework for these efforts.*

Traffic congestion is also an impediment to our own health. Vehicle emissions account for 28 percent of all emissions of hydrocarbons, which leads to ozone pollution. Most of our metropolitan areas are not in compliance with federal standards for safe ozone levels, due in part to the growing congestion problem.

Congress and the Administration must be congratulated for the passage of the 1990 Clean Air Act Amendments. The Institute and its membership care about the environment, and we consider this legislation critical to the environment's well-being. *We believe it is essential that the Clean Air Act and other environmental legislation, the National Energy Policy, and the Surface Transportation Assistance Act work together to avoid conflicting requirements and objectives that may result in counterproductive efforts.* For example, the proposed legislation requires the implementation of congestion management plans to reduce fuel consumption, but the legislation apportions funds, to a large extent, based on fuel consumption. We are concerned that the heavy weighting given to fuel usage provides little, if any, incentive for multimodal, energy-conscious transportation goals and programs. For example, if a state is successful in its congestion management and thus less fuel is consumed, the state could end up losing funds. *We encourage Congress to take the necessary steps to avoid conflicting requirements.*

H.R. 1351 contains provisions to effectively deal with the surging transportation demand. *It would require states to implement areawide multimodal congestion management plans. Urbanized areas with populations over 200,000 would be required to develop a congestion management plan that would provide for the effective management of new and existing transportation facilities through the use of travel demand reduction and operational management strategies.* In addition, the bill continues to require that urbanized areas have a Metropolitan Planning Organization (MPO) and produce a Transportation Improvement Program (TIP). *The Institute endorses these provisions as outlined in the bill and will work to ensure effective implementation of these provisions.*

However, no single approach to addressing our long-term transportation needs will be adequate. A combination of a group of alternatives, as documented by the Institute's publication, *A Toolbox to Alleviate Traffic Congestion*, is a more realistic approach. To get the most out of our investment in new and existing facilities, additional emphasis must be put on traffic operations programs.

The Administration's bill allows and encourages these operational programs. States would be permitted to use funds for operational improvements, such as traffic surveillance, motorist information, incident management, high-occupancy vehicle (HOV) preferential treatments, demand management, and spot geometric/traffic control modifications, to alleviate bottlenecks and hazards.

*To improve mobility, comprehensive strategies that combine all modes of transportation are needed—strategies that aim at improving the urban transportation system as a whole, including transit improvements, operational improvements, and transportation demand management strategies.*

## Safety

Highway safety needs to be given increased emphasis and funding. Highway safety improvements are responsible for saving an estimated 50,000 lives and preventing almost one million injuries since 1974. Injuries from motor vehicle crashes destroy the health, lives, and livelihoods of millions of people, yet they receive scant attention, compared with diseases and other major health hazards. Statistics show that:

- Motor vehicle crashes account for more than 45,000 deaths and more than 3 million injuries each year—of which 1.8 million are disabling.
- Each year, motor vehicle crashes in the United States create more new quadriplegics and paraplegics than all other causes combined.
- Traffic crashes are the leading cause of death for all American citizens under the age of 44. Except for cancer, motor vehicle deaths and injuries constitute the highest national economic costs produced by any public health problem.

Traffic crashes represent a national health problem. Growing traffic volumes are offsetting the safety gains made through state safety-belt use laws and improved roadway design. If traffic volumes continue to grow at the current rate, and if the fatality rate is not lowered, the annual death toll could reach 80,000 by the year 2000. Yet needed federal highway safety funds have been cut by more than half in recent years.

Not only is continued federal involvement justified, but a special national priority is warranted. A reduction in the number of annual fatalities due to traffic accidents should be a national goal. *A combined national transportation safety program is desirable, allowing state and local agencies the flexibility to apply traffic crash countermeasures that will most effectively reduce the risk of death and injury in their jurisdictions.*

The safety program provisions included in the Administration's bill do contain most of the elements recommended by ITE, including the creation of bonus incentives through a set-aside program, which would accelerate the advancement of highway safety. *We congratulate the U.S. Department of Transportation for its concern for highway safety, and we urge you to consider highway safety as one of the main objectives of this bill.*

## The National Highway System

The importance of the federal role in ensuring a safe and efficient highway system for interstate travel is unquestioned. Attention must be focused on protecting our investment in the Interstate System by properly maintaining these roads, enhancing their capacity, and when needed, providing additional capacity.

H.R. 1351 establishes a new National Highway System. The new system would include any highway whose main function is the service of interstate and long-distance travel, including all segments of the current interstate highway system, selected portions of the primary highway system, and new facilities constructed to bypass congested urban areas. The system would prioritize future federal aid.

*The Institute supports the establishment of the National Highway System but urges this subcommittee to expand the proposed total mileage in the system.* A preliminary review of the Administration's proposed 150,000-mile system indicates many miles of roads currently on the federal-aid urban system would be excluded. Some of the excluded roads carry significantly more traffic and affect interstate commerce more than some of the interstate highways included in the system.

## Small Urban and Rural Secondary Highways

In the last 30 years little attention has been paid to this nation's rural secondary highways. In recent years, the volume and weight of truck traffic on these roads have increased substantially, accelerating the deterioration of this system. Bad rural roads increase the price of American products, adversely impacting American consumers, as well as undermining our international competitiveness.

A continued federal role in small urban and rural areas is welcomed. It would ensure a minimum acceptable level of service for personal travel and goods movement. With adequate federal assistance, small cities and rural areas would be able to enhance the safety of this transportation system, provide access to interstate roads, spur economic development, serve industry, and provide scenic and recreational driving opportunities for the traveling public. *We must ensure that key rural roads are properly maintained; however, rural and urban programs should be kept separate, so that the urban congestion problem can be adequately addressed. H.R. 1351 does propose an acceptable level of support for highways in small rural and urban areas.*

## Transportation Planning

In the coming years, some of the social and demographic trends we see now will continue. Current trends, such as the aging population, will continue, and new trends will emerge. These trends must be identified, monitored, and planned for, and innovative ways must be developed to address transportation needs and demands.

At the local and regional level transportation and land use decisions must be better coordinated. Although the agencies approving land use and those responsible for transportation are often at different levels of government, each must be kept apprised of the other's decisions and their associated implications.

With more than three-quarters of the population affected by urban and suburban congestion, the federal role in the other key highways should not only be maintained, but should also be strengthened.

*The Administration's bill allows more emphasis on coordination with land use planning, including impacts of land use decisions on transportation needs, and more emphasis on consideration of transportation-related air quality problems.* It also gives priority to full consideration of congestion management before deciding on major capital investment. The Institute supports the general provisions of this bill in this regard.

## Data Collection and Systems Performance Evaluation

The current Highway Performance Monitoring System (HPMS) does not gather specific data to measure the operational performance of the federal-aid system. Most of the projections of congested conditions are prepared by comparison of calculated capacity to actual volume of traffic and calculating a level of service. These calculations do not allow for the accurate inclusion of the impacts of traffic incidents or operational improvements or deficiencies.

Although we know, through observation and the public's outcry, that traffic congestion is getting worse, we have no accurate measure of traffic congestion and the specific changes over time on a nationwide, system, or specific facility basis. This deficiency has been recognized by the transportation community and efforts are underway within the profession to define the necessary data elements that will allow this important measure of system performance to be gathered and reported. The Institute feels that these data are as important as the data gathered regarding the physical condition of the highways on the federal-aid system. We feel that Congress should have the benefit of this performance measure so that its members can, in their oversight role, keep track of the effectiveness of the investments that they have authorized and so that the effectiveness of investments in operational improvements can be measured and their cost effectiveness be calculated. *The relationship of traffic congestion to degradation of air quality and excessive consumption of gasoline makes this an important measure to monitor. Congress*

*should call for such measurements to be undertaken and communicated as part of the U.S. Secretary of Transportation's report to Congress.*

## Research and Technology

Current federal expenditures on highway research are less than one percent of the total highway program. The Transportation Research Board estimated in 1984 that spending on highway research constituted only 0.15 percent of the nation's highway expenditures. A substantial portion of the current set-aside of funds for "highway planning and research" (HPR) is spent on planning, not research. Unless a stronger national commitment is made, this nation will become more dependent on foreign technology to meet our future transportation needs.

Advanced technologies now emerging, such as intelligent vehicle/highway systems, need to be assessed, developed, tested, and implemented for all modes. The technology program should focus on true transportation needs for both the short-term and the long-term future.

*The Administration's bill focuses on highway research and development (including safety and planning), intelligent vehicle/highway systems, and more private-sector involvement. It would also establish and maintain a national research and technology coordination and communication mechanism among transportation organizations. The Institute supports these provisions.*

## Transportation Training

There is a shortage of technically competent personnel to meet the current and future requirements of the nation's transportation needs. Federal action is needed to support and stimulate the education and training of transportation professionals.

New technologies, such as intelligent vehicle/highway systems, will need to be developed and implemented to help meet our mobility needs in the future. This will also increase the demand for trained transportation professionals to plan, design, operate, and maintain these systems.

To maximize the benefits and fully utilize these systems, operational improvements require competent professional staffing and adequate and predictable funding. There is a need to attract more qualified people into the transportation profession. Therefore, renewed emphasis should be placed on education, training, and retention of transportation personnel—especially by the local and state agencies. The continuation of the Federal Highway Administration's Centers of Excellence program and the funding of the National Highway Institute, as outlined in H.R. 1351, are good steps in this regard.

*The bill also provides for local training and technical assistance provisions for rural areas. It also contains provisions for technical assistance for urban transportation agencies. The Institute endorses these training provisions but recommends an increased funding level for local training for both rural and urban areas.*

## Federal Funding

In recent years, the Institute has not called for significant increases in funding levels for highway and transit programs. Although we recognized the need for transportation funding increases, we also recognized that transportation professionals do not live in a vacuum—that the size of the federal budget deficit would, for the time being, temper the amount of resources that could be allocated to transportation programs. The Institute asked that transportation programs be authorized to spend down the growing balance in the Highway Trust Fund—funds that were collected with the promise that they would be invested in our nation's transportation system.

The Institute believes that, once the balance is spent down, additional revenues will need to be raised through a gas tax increase to support the needed level of federal investment in highways and transit systems. H.R. 1351 does not adequately address the nation's transit funding needs. If reducing traffic congestion and improving air quality and mobility are our objectives, then the existing investment in public transportation systems must be preserved, and ridership on those systems must be maximized. We must continuously seek viable, cost-effective public transportation alternatives, including ridesharing, and we must maximize the effectiveness of such alternatives.

We cannot, however, ignore the fact that in recent years this country has been negligent in investment of capital in its transportation system. In addition, improved fuel mileage (resulting in less gasoline tax paid at the pump per mile driven) and diversions and evasion of payments into user-financed transportation trust funds have further eroded the resources available.

Over the years, the funding from the Highway Trust Fund and the states has been used primarily for the development of a viable highway system of national defense and for interstate commerce. The increasing congestion problems in urban areas indicate that it is time to consider broader options, to fully understand the different approaches to transportation funding being used in other parts of the world.

*We must ensure that income to the Highway Trust Fund keeps pace with the demonstrated need to protect our investment in the system and provide for an acceptable level of mobility.*

For example, the federal tax exemption on gasohol is having a growing adverse effect on Highway Trust Fund revenues. This exemption is costing the Highway Trust Fund more than half a billion dollars each year. If the purpose of the gasohol exemption is to conserve energy and improve air quality, it should not take money from the source of funding necessary to implement transportation improvements that would also help to achieve these goals.

*Programs are needed to cover the timeframe of a typical project from conception through implementation, a period that may take several years.* In order to provide this continuity, funding authorizations for periods or five years or longer have been recommended by the Institute. Funding continuity would allow for projects to be operational and maintained after the implementation has been completed.

Traffic control systems and, more recently, intelligent vehicle/highway systems require significant annual funding to maximize their contribution to traffic flow and safety and to allow them to adapt to changes in conditions and needs. *The operations and maintenance costs of these systems are significant.* For example, the Dade County, Florida, traffic control system, which controls over 2,000 signalized intersections in the Miami area, has a yearly operations and maintenance bill of over 2.5 million dollars. *If funding is provided to develop and implement these technically complicated systems, we must make sure that funds and qualified personnel are available to keep them operating optimally.* Operation and maintenance funds would allow for the full utilization of these systems and would maximize the return on the initial investment.

The requirements for management plans (congestion, safety, bridge, pavement) should provide a better, more systematic approach for developing priorities for federal funding of capital and operating programs. *We support this concept, but urge that these management plans be administered on an integrated basis, not as separate evaluation programs.* A proposed program that may be fully warranted and cost-effective based, for example, on combined bridge, safety, and congestion characteristics may not get the appropriate funding priority if evaluated separately, as a bridge, safety, or congestion concern.

In the past, funding program categories for each separate highway system and public transportation system precipitated planning and development of projects separately by system and mode. Today, *it is necessary to encourage the safest and most energy efficient, economical, and environmentally compatible transportation system that utilizes the inherent advantages of each transportation mode and ensures that public and private transportation systems are reasonably available where needed.* The services provided by highways, parking facilities, and transit facilities in congested areas cannot be addressed separately. Each affects the other. A multimodal approach is needed.

*The Administration's bill does provide for a five year program, a provision endorsed by the Institute.* The Institute feels that highway users will support a raise in the federal gas tax if they can see that it will be used to meet a legitimate need to improve the transportation system. Although H.R. 1351 takes a step in the right direction by providing for additional highway funding over the authorization's obligation ceiling for fiscal year 1991 we feel additional funding is needed to meet today's and tomorrow's needs.

## State and Local Transportation Funding

Artificial barriers, placed on one level of government by another, to the implementation of public and private funding strategies that are otherwise feasible and acceptable to the public should be removed.

Federal tax policy, for example, encourages employers to provide incentives to those who commute to work in a private automobile, while discouraging the same for those who use transit or vanpools. Employer-provided free parking is considered to be a "working condition fringe benefit" and is therefore specifically excluded from being taxed. Yet transit passes worth more than $15 per month or employer-provided vanpools are considered to be taxable fringe benefits. This has inhibited employers from providing such assistance. *Eliminating the current tax on transit subsidies would encourage employers to provide a transit subsidy as an employee benefit.*

Toll roads on federal-aid highways are another example. Experiences from around the country are now showing that the traveling public in many cases is willing to pay a premium for the luxury of faster, more efficient transportation. Some state and local agencies have been able to use toll financing to pay for facilities that otherwise would not have been funded, to expedite transportation projects, to maintain transportation facilities, and to make improvements to highways and other transportation facilities to sustain high levels of service.

The Administration's bill allows states to use their apportioned funds for improvements on any facility that is part of the National Highway System, including existing toll roads and for the construction of new non-interstate toll roads. In addition, states may combine federal aid with toll and other financing to reconstruct and replace existing free bridges and also reconstruct non-interstate highways to add lanes and to change their character to fully controlled access highways. The Institute endorses these provisions.

## Conclusion

*The need for adequate and continuing federal transportation funding is undeniable. The provisions contained in H.R. 1351 do establish a framework from which Congress can fashion a bill that addresses the concerns raised herein. The Administration's restructured highway program, added funding, and increased flexibility are steps in the right direction. We urge you to aggressively pursue the schedule that you have adopted for an adequate surface transportation program, as described herein. Most importantly, the Institute urges you to enact the Surface Transportation Assistance Act before October 1, 1991.*

STATEMENT FOR THE U.S. HOUSE OF REPRESENTATIVES
PUBLIC WORKS AND TRANSPORTATION COMMITTEE;
SUBCOMMITTEE ON SURFACE TRANSPORTATION

BY NORMAN LANGBERG
DIRECTOR OF TRANSPORTATION AND DISTRIBUTION
GEORGIA-PACIFIC CORPORATION
ATLANTA, GEORGIA

This statement is presented for the record of the April 18, 1991, Public Hearing on 1991 Highway Reauthorization, on behalf of Georgia-Pacific Corporation.

My name is Norman Langberg, I am Director of Transportation and Distribution for Georgia-Pacific's Pulp & Paper Group. Prior to this I was employed by a major transcontinental railroad. I've been in the transportation field for over 20 years.

Georgia-Pacific Corporation, with headquarters in Atlanta, Georgia, employs over 60,000 employees, manufactures and distributes a wide variety of paper products and building materials throughout the United States.

My statement is submitted on behalf of the American Paper Institute, the national trade organization of the Pulp, Paper and Paper Board Industry, consisting of approximately 175 companies producing 90% of the nation's output of these products. I am our company's representative on the American Paper Institutes' Transportation Committee and serve as Chairman of the Motor Carrier Subcommittee. Georgia-Pacific is also a member of the Americans

for Safe and Competitive Trucking, a broad coalition of manufacturers, wholesalers, and retailers that support uniformity of intrastate trucking.

The Motor Carrier Act of 1980, significantly removed the economic regulations applicable to interstate truck transportation. Specifically, the Motor Carrier Act discontinued anti-competitive practice such as "bureau rate making", restrictive or exclusive operating authorities, and "cost-based" rate making. These practices are widely viewed as the outmoded results of an inefficient regulatory scheme.

As a result of the Motor Carrier Act of 1980, truck rates declined and stabilized over the last decade. Efficient, fair cost transportation is key for U.S. industries to remain competitive with each other as well as with foreign countries.

Over forty states continue to regulate the economic aspects of intrastate trucking. This is accomplished in many ways: restrictive and discriminatory awarding of operating authorities; continuing antitrust immunity, enabling favored motor carriers to jointly discuss and set rate levels; discriminatory costs and procedures for permitting and taxing out of state carriers; and continued public utility commission overview of rate levels based upon "cost-of-service" guidelines which do not acknowledge the normal competitive advantages of the marketplace.

The end result of this regulation is that many states continue to disrupt the productivity of motor carriers, inflate the freight charges of the nation's shippers and customers, and negatively impact efficient highway use.

Each year Georgia-Pacific pays an estimated $5 million in additional freight charges as a result of the restrictive regulatory environment in these states. While Georgia-Pacific operates in all 50 states, we are significantly impacted in 27 states. I have attached to my statement a series of comparisons which illustrate the national and state impact of intrastate regulation.

Let me share with you two examples:
Georgia-Pacific manufactures tissue products at Palatka, Florida and LaGrange, Georgia. An intrastate move from LaGrange, Georgia to Atlanta, Georgia (63 miles) costs $228. An interstate move from Palatka, Florida to Atlanta, Georgia (354 miles) cost $265.

Georgia-Pacific manufactures a wide variety of paper and building products at Crossett, Arkansas. An intrastate move from Crossett, Arkansas to Texarkana, Arkansas (131 miles) costs $350. An interstate move from Crossett, Arkansas to Texarkana, Texas (135 miles) cost $250.

In addition to the freight cost issue brought about by intrastate regulation, the administrative impact of individual state's

regulations can be a confusing and expensive burden for both carriers and shippers.

The state of California is an excellent example of bureaucratic activity which changes the structure by which carriers are regulated rather than accomplishing a meaningful objective. California's intrastate transportation environment of new carriers has been an ongoing issue for over a decade.

Prior to 1980, the P.U.C. in California set minimum rates, and issued all tariffs utilized by freight carriers. In April of 1980, the P.U.C. canceled it's tariffs and substituted a "transition" regulatory program which required the submission of elaborate cost justification by carriers who wanted to assess rates which were below P.U.C. established levels. In 1986, California P.U.C. canceled it's "transition" program and substituted a new cost-based, carrier-filed rate program which required the submission of new cost justification for all rate reductions below the level of the carriers "base rates". The P.U.C. decision also ordered a 10% mandatory increase in all carrier rates effective May 5, 1986, and required all common carriers to file their own tariffs. Prior to this, many carriers had been allowed to adopt the P.U.C's tariffs as their own.

In February of 1990, the P.U.C. canceled it's cost-based, carrier filed rate program and substituted a new program of more flexible rate making which does not require cost justification. Under this

new program, contract carriers are able to establish rates without P.U.C. authorization subject to contract filing agreements, tariff formatting restrictions, and other administrative guidelines. THis activity was hailed by many as a truly enlightened action by the state of California to introduce economic freedom to the trucking industry. For the past eleven years, regulatory uncertainty has ruled the state of California. At this time, there are several coalitions in the state of California attempting to return to the P.U.C. "cost-based" regulation. It is likely the regulatory scheme will continue to change every few years depending upon the make-up of the Public Utility Commissioners and the effectiveness of various trucking and shipper groups.

How does Georgia-Pacific attempt to reduce shipping costs and remain competitive? We operate our own trucks in intrastate movements. Referring to the Georgia illustration, we have two power units and six trailers moving between Atlanta and LaGrange, Georgia. In total we operate approximately 100 power units in the state of Georgia. This is an example repeated in most of the intrastate regulated states. We cannot afford to use intrastate carriers because the regulated price is too high. In fact, the intrastate carrier is the loser in this situation as well as the consumer.

This is <u>not</u> a single state issue. We are experiencing problems in many states. In some cases, we must serve a state market from an adjoining state to avoid intrastate shipments. This is not

efficient from a transportation standpoint, but it is more cost effective. It is a pervasive issue which ultimately restricts the competitiveness of our nation's manufacturers.

We believe the legislation introduced by Representative Ron Packard (H.R. 1064), or Sections 305 and 508 of H.R. 1351 by the Administration, are reasonable approaches which will allow motor carriers and shippers operating within a single state the same economic freedom which has existed in interstate transportation over the last 10 years. At the same time, the proposed legislation will facilitate uniformity in safety, taxation and reasonable entry into intrastate movements of motor carriers operating over federal, state and local highways. We urge that the intrastate truck problem be included in the 1991 Highway Reauthorization Bill.

Washington, D.C. 20515

Re: **Response to NPTC and ATA Testimony on H.R. 1351, a Bill Proposing the Surface Transportation Assistance Act of 1991**

Dear Chairman Mineta:

The witness for the National Private Truck Council (NPTC), in testifying on the above legislation on April 18, 1991, before your Subcommittee, stated that it costs $296.00 to ship 36,000 lbs. of cherries interstate from the small rural community of Grandview, Washington, to Portland, Oregon, whereas the same shipment intrastate from Grandview to Spokane, Washington, costs $597.00.

In response, the NARUC respectfully submits the enclosed Memorandum from the Washington Utilities and Transportation Commission (UTC), dated April 26, 1991, which shows that the interstate rate is "far from compensatory" unless the carrier was fortunate enough to get a loaded backhaul from Portland to Grandview, an unlikely event. Moreover, the UTC says that under its regulatory system any shipper or carrier may file a proposal to lower any rate deemed excessive, and that a recent UTC audit of carrier billing revealed that interstate rates were higher than intrastate ones for comparable traffic.

The American Trucking Associations, Inc. (ATA), in its testimony, called for the repeal of Public Law 89-170 (49. U.S.C., Sec. 11506), referring to it as "a paperwork nightmare" costing "many millions of dollars annually." However, ATA thought 89-170 was fine, from its inception in 1965 until sometime after 1980, as a means to encourage States to prosecute illegal interstate carriers operating without ICC authority. After the Federal Motor Carrier Act of 1980 made ICC authority easy to obtain, the ATA lost interest in paying for State enforcement. Nevertheless, the public need continues.

89-170 authorizes State agencies, under standards developed by the NARUC and promulgated by the ICC [49 C.F.R., Part 1023], to require the registration of an interstate carrier's operating authority issued by the ICC, its current insurance status and its designated local agent for the service of legal process.

The States are permitted to collect a one-time registration fee of up to $25 per carrier, and an annual fee of up to $10 per vehicle for registration renewal -- a form of user fee consistent with legislation enacted by the Congress and supported by the Administration to fund Federal regulatory programs. Such fees generate over $55 million in annual revenues nationwide for the thirty-nine participating States, and may be increased by raising the fee ceilings.

The above legislation would eliminate the State registration of motor carriers' ICC authority, and thereby render this Federal requirement unenforceable since the ICC does not have an adequate field staff. So long as the Congress chooses to have the ICC issue certificates and permits to interstate carriers, the requirement should be enforced. Otherwise, the law becomes a mockery. Even if these authorities were replaced by fitness certificates, the need for enforcement would continue.

Also, without 89-170, who would prosecute interstate carriers operating with lapsed insurance?

Rather than repeal, we believe that 89-170 should be strengthened by our enclosed amendments to expand its scope to include specifically the enforcement of safety laws, dedicating all money collected by the States to carry out the original purposes of 89-170 plus increased safety enforcement, and to convert the evidence of compliance from the current cab card-stamp to a base State system, which would reduce administrative costs for the truckers.

Safety will be a continuing problem. Our amendments would employ user fees to fund intensified State safety enforcement and reduce the pressure for increasing appropriations for the Motor Carrier Safety Assistance Program (MCSAP).

Please have this letter and enclosures published as a part of the record of the hearings on the legislation.

Thank you.

Sincerely yours,

Paul Rodg

**REBUTTAL STATEMENT**

SUBJECT: Transportation Pricing in a Regulated versus Non-regulated Environment

In the state of Washington, the legislature has deemed it is in the public interest to regulate for-hire truck transportation to ensure that the citizens of the state have a safe, stable transportation service that offers rates that are reasonable, compensatory and non-discriminatory.

When comparing interstate and intrastate transportation pricing you can not make a fair evaluation of the rates' affect on the transportation service provided, unless you also consider the cost of service. In any rate-making decision, there has always been a link between price and cost of service. That is, it is necessary to ascertain the total revenue that is required before the specific price that yields total revenue can be established. To do this means total cost must be calculated as well as the amount of fair profit.

Therefore, for purposes of fair evaluation or comparison of whether intrastate or interstate rates are at reasonable levels, given the transportation environment motor carriers are operating in, out-of-pocket costs need to be calculated. Basically, transportation pricing analysts use out-of-pocket cost (incremental cost or variable cost) as the benchmark in which rates should not be allowed to be set below. This should be the measuring stick, so-to-speak, in making a fair evaluation of intrastate rate levels compared to interstate rate levels.

The NPTC, at the April 18th hearing, testified as to the difference in costs to a shipper shipping the same commodity in interstate versus intrastate commerce. There is no mention whether the interstate rate is compensatory to the carrier. The truth is the Grandview to Portland example (190 miles) at $296.00 for the haul would equal $1.56 per loaded mile, one way, or 78 cents per round trip mile (if carrier had to return empty); 78 cents is far from compensatory. A similar trip from Grandview to Vancouver in Washington State Tariff 4-A is $532.80. This calculates to $2.80 per loaded mile and $1.40 per running mile. Formal testimony given at Commission hearings considering proposed rate items, is that the $1.40 running mile is at or near the break-even point for many carriers.

There is a misconception by those outside of the industry that every loaded movement should result in a loaded backhaul for the motor carrier. Motor carriers strive to operate as efficiently as possible by balancing the front haul with an equally compensatory backhaul. In the real world, this is not always possible, since commodity flow between two different geographic areas is not always balanced. That is why pricing strategies may take into account empty backhaul movement because of this imbalance of traffic flow. We spoke to two carriers who operate out of the Grandview, Washington area. One of the carrier's spokesman said that the NPTC rate quote for hauling cherries from Grandview to Portland would require a guaranteed loaded backhaul just to break even. Otherwise, the rate would not generate enough revenue for the carrier to pay for its out-of-pocket costs of operation. Since it is unusual that a carrier is given a guaranteed backhaul, this carrier spokesman said, "I would be a fool to take that interstate rate."

In a recent audit of a carrier's billing, we found the carrier charging higher interstate rates (even with a 40% discount) to move certain commodities between two points in the state of Washington than would have applied had the shipments moved using intrastate tariffs. We bring this to your attention as an example of situations in which the intrastate rates may be lower than an interstate rate even after the discount is applied. We are aware there are situations where the interstate rates may be lower than the intrastate rates. To highlight one particular rate over another without considering all of the factors involved and attempt to use that rate as an example why the states should be deregulated fails to consider all of the consequences deregulation may bring.

This Commission takes its motor carrier rate and service regulations seriously and attempts to balance the needs of the shipping public while ensuring safe, reliable, and a stable transportation system for the citizens of the state.

In conclusion, it is not appropriate for NPTC to isolate one single rate and use it as an example intimating higher costs are imposed on shippers due to regulation. In our system of regulation, if a rate is excessive, any carrier may file a rate proposal to lower the rate. If there should be any questions, please feel free to call Alan Scott, Transportation Operations Manager, Washington Utilities and Transportation Commission, (206) 753-6410.

**NARUC Proposed Amendments to**
**H.R. 1351, a Bill Proposing the**
**Surface Transportation Assistance Act of 1991**

The National Association of Regulatory Utility Commissioners (NARUC) respectfully requests that H.R. 1351 be amended by:

(1) Striking: lines 17 through 24 on page 265, and lines 1 through 2 on page 266; and by redesignating subsections (b), (c), (d) and (e) on pages 266 through 268 as (a), (b), (c) and (d), respectively;

(2) Striking lines 1 through 4 on page 273; and

(3) Striking lines 12 through 25 on page 273, and lines 1 through 10 on page 274, and inserting in lieu thereof the following:

"Section 11506 of title 49, United States Code, is amended by redesignating subsection (e) as (g) and inserting between subsections (d) and (g) two new subsections to read as follows:

"(e) All fees collected by a State under this section shall be used to carry out the purposes of this section and to enforce Federal and State safety laws governing motor carriers. The use of such fees shall be subject to audit by the Commission or by other federal agency designated by the Commission.

"(f) The national organization, within one year after the effective date of this subsection, shall amend the standards to implement a base State system of annual registration whereby a motor carrier shall register with one State participating in the standards (base State) and thereby satisfy the registration requirements for all States participating in the standards. The motor carrier shall pay the required fees directly to the base State for equitable allocation among all States participating in the standards with respect to the motor carrier. If the national organization shall fail to so amend the standards within such year, the Commission shall so amend the standards within eighteen months after the effective date of this subsection. The standards, whether so amended by the national organization or the Commission, shall become effective three years after the effective date of this subsection."

April 3, 1991

**NARUC Proposed Amendments to**
**H.R. 1064, a Bill Proposing the**
**Safe and Competitive Trucking Act of 1991**

The National Association of Regulatory Utility Commissioners (NARUC) respectfully requests that H.R. 1064 be amended by:

Striking lines 2 through 26 on page 3 and lines 1 through 24 on pages 4 and 5, and inserting in lieu thereof the following:

"Section 11506 of title 49, United States Code, is amended by redesignating subsection (e) as (g) and inserting between subsections (d) and (g) two new subsections to read as follows:

"(e) All fees collected by a State under this section shall be used to carry out the purposes of this section and to enforce Federal and State safety laws governing motor carriers. The use of such fees shall be subject to audit by the Commission or by other federal agency designated by the Commission.

"(f) The national organization, within one year after the effective date of this subsection, shall amend the standards to implement a base State system of annual registration whereby a motor carrier shall register with one State participating in the standards (base State) and thereby satisfy the registration requirements for all States participating in the standards. The motor carrier shall pay the required fees directly to the base State for equitable allocation among all States participating in the standards with respect to the motor carrier. If the national organization shall fail to so amend the standards within such year, the Commission shall so amend the standards within eighteen months after the effective date of this subsection. The standards, whether so amended by the national organization or the Commission, shall become effective three years after the effective date of this subsection."

**PUBLIC LAW 89-170**

The relevant portion of Public Law 89-170, 79 Stat. 648, approved September 6, 1965, amended Subsection (b) of Section 202 of the Interstate Commerce Act and, as recodified by Public Law 95-473, 92 Stat. 1448, approved October 17, 1978, 49 U.S.C., Sec. 11506, reads as follows:

Section 11506. Registration of motor carriers by a State

(a) In this section, "standards" and "amendments to standards" mean the specification of forms and procedures required by regulations of the Interstate Commerce Commission to prove the lawfulness of transportation by motor carrier referred to in section 10521 (a)(1) and (2) of this title by--

(1) filing and maintaining certificates and permits issued to the motor carrier by the Commission;

(2) registering motor vehicles operating under the certificates and permits;

(3) filing and maintaining proof of required insurance coverage or qualification as a self-insurer; and

(4) filing the name of a local agent for service of process.

(b) The requirement of a State that a motor carrier, providing transportation subject to the jurisdiction of the Commission under subchapter II of chapter 105 of this title and providing transportation in that State, register the certificate or permit issued to the carrier under section 10922 or 10923 of this title is not an unreasonable burden on transportation referred to in section 10521(a)(1) and (2) of this title when the registration is completed under standards of the Commission under subsection (c) of this section. When a State registration requirement imposes obligations in excess of the standards, the part in excess is an unreasonable burden.

(c)(1) The Commission shall maintain standards and amendments to standards (A) prepared and certified to it by the national organization of the State Commissions, and (B) prescribed by the Commission. If the national organization determines to withdraw entirely standards prescribed by the Commission, the Commission shall prescribe new standards by the end of the first year after the national organization determines to withdraw the standards.

(2) An amendment to the standards prepared and certified by the national organization and prescribed by the Commission is effective when the amendment is prescribed or at another time as determined by the national organization.

(d) The national organization shall consult with the Commission and representatives of motor carriers subject to the State registration requirement when preparing amendments to the standards. Different amendments may be prescribed for each class of motor carriers as warranted by the differences in the operations of each class.

(g) This section does not--

(1) authorize standards in conflict with regulations of the Commission; or

(2) affect the authority of the Commission to interpret its regulations and certificates and permits issued under section 10922 or 10923 of this title.

(e) All fees collected by a State under this section shall be used to carry out the purposes of this section and to enforce Federal and State safety laws governing motor carriers. The use of such fees shall be subject to audit by the Commission or by other federal agency designated by the Commission.

NARUC PROPOSED AMEND-MENT

(f) The national organization, within one year after the effective date of this subsection, shall amend the standards to implement a base State system of annual registration whereby a motor carrier shall register with one State participating in the standards (base State) and thereby satisfy the registration requirements for all States participating in the standards. The motor carrier shall pay the required fees directly to the base State for equitable allocation among all States participating in the standards with respect to the motor carrier. If the national organization shall fail to so amend the standards within such year, the Commission shall so amend the standards within eighteen months after the effective date of this subsection. The standards, whether so amended by the national organization or the Commission, shall become effective three years after the effective date of this subsection.

RECOMMENDATIONS TO HOUSE COMMITTEE ON PUBLIC WORKS

AND

TRANSPORTATION SURFACE TRANSPORTATION SUBCOMMITTEE

ON

SURFACE TRANSPORTATION ACT

ELDERLY TRANSPORTATION

(4/24/91)

The New York City Department for the Aging is the largest Area Agency on Aging in the U.S. representing more than 1.3 million older New Yorkers over the age of 60 who live in the City's five boroughs.

Adequate, accessible transportation is a critical factor that enables many older persons to maintain their independence. Transportation is the crucial link that provides individuals access to services and programs from which they can benefit.

We in New York City are becoming increasingly concerned about the growing need for accessible, available transportation for the elderly. During the past decade, the City's frail older population has grown by about 20 percent. As this frail elderly population increases, it becomes even more critical that transportation services be available to help them remain in their communities. Because mobility is often one of the first functions to become impaired with advancing age, availability of transportation can be the critical factor in enabling an elderly individual to continue living independently. One out of every five older New Yorkers has difficulty walking and one out of ten have difficulty in getting out of their home.

Although New York City has a public transportation system which unimpaired elderly New Yorkers can use at a reduced fare, and while significant improvements have been made in the accessibility of the City mass transit system, for most frail or

disabled elderly, public transportation is simply not a viable option.

At the present time, only 3 percent of New York City's subway system is accessible. Although increasingly the City's buses are lift-equipped (over 75%), there are still many barriers that prevent seniors from using the regular bus system, including bus stops that are situated beyond the individual's ambulatory ability, trips that require numerous transfers, long waits for a bus to arrive, and the likelihood of having to stand while riding the bus.

To provide the transportation services that New York City's elderly need, our Department and other City agencies are working on a number of fronts. During New York City's current fiscal year, the Department for the Aging will fund over 500,000 one-way trips for the elderly in New York City, through the non-profit organizations it contracts with to provide transportation service throughout the City. These community-based transportation programs are located in each of the five boroughs. This service is available to older adults who are age 60 or older for the purpose of attending congregate meal sites, senior centers, social service activities and essential medical and other appointments and activities.

The New York City Department for the Aging uses Older American's Act Title III-B funds to support transportation

services because, otherwise, many seniors would be unable to get to senior centers to participate in the meals programs and other services, or even get to the hospital, clinic or doctors' offices for needed health care services. Unfortunately, since New York City now has severe fiscal constraints, Title III-B funds are increasingly needed for other essential in-home services.

The Urban Mass Transit Act Section 16(b)(2) program has been very important to the non-profit agencies in New York City that provide transportation service to the elderly in enabling them to obtain vehicles.

Just over a year ago, the City established with City funds Access-A-Ride, a paratransit system which is a City-wide door-to-door advance reservation service. Seventy percent of Access-A-Ride users are transportation disabled persons over age 60. Since its funds are very limited, the number of trips that Access-A-Ride can provide is also limited.

The need to expand transportation services for the elderly is evidenced by the length of waiting lists for seniors needing transportation assistance maintained by the Department for the Aging's community-based contractor agencies. It has also been a major concern presented in testimony given at the Department's annual Public Hearings on the Area Plan for the Older Americans Act and the New York State Community Services for the Elderly Act as well as in recent borough planning meetings. Based on the

Department for the Aging's work with the Department's Senior Transportation Advisory Group and the City Transportation Disabled Committee, as well as reports we continually receive from the community, there is a critical need for additional transportation services for seniors.

Department for the Aging recommendations relating to the reauthorization of the Urban Mass Transit Act include:

1.) This year, $35 million has been allocated to serve the disabled and elderly nationally through the Section 16(b)(2) program. Due to the large increase in the number of frail elderly in the City and in the country as a whole there are increasingly large numbers of transportation disabled elderly who need special transportation services. The 16(b)(2) program has been very important to the non-profit agencies in New York City, that provide transportation service to the elderly, in enabling them to obtain vehicles. We recommend that there be at least a doubling of these funds next year.

2.) At the present, the 16(b)(2) program does not provide assistance to cover the operating costs of the vehicles obtained under the program. Service programs, already stretched to provide needed services, must provide 100 percent of the resources necessary to operate and maintain these vehicles and equipment. We recommend authorizing operating expenses to non-profit agencies to provide transportation for the elderly, be added under Section 16(b)(2).

.) Amendment to the law to require that all vehicles purchased nder Section 16(b)(2) must be "Accessible" for the elderly nd/or persons with disabilities.

.) The establishment of a mechanism to purchase transportation .iability coverage for service providers on a group basis to ›btain lower premiums. Increasing insurance premium levels have ieant a diversion of funds from critically needed social ;ervices. We urge exploration of this by the Federal government.

SCENIC AMERICA

STATEMENT OF SALLY G. OLDHAM
PRESIDENT, SCENIC AMERICA

SUBMITTED TO THE

U.S. HOUSE OF REPRESENTATIVES
SUBCOMMITTEE ON SURFACE TRANSPORTATION

OF THE

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

APRIL 18, 1991

216 Seventh Street, S.E., Washington, D.C. 20003 (202) 546-1100

Mr. Chairman, and members of the Subcommittee, Scenic America and a broad coalition of more than 60 national, regional and local groups representing more that 5 million members, appreciates the opportunity to present this statement to the Subcommittee on Public Works and Transportation.

This diverse coalition of groups -- made up of environmental, public health, municipal, professional and business groups -- has come together to urge Congress to reform the Highway Beautification Act of 1965 (HBA) by including H.R. 1344, the Visual Pollution Control Act of 1991, in the subcommittee's Surface Transportation Assistance Act.

## WHY IS THIS LEGISLATION NEEDED?

Though initially successful, due to inherent flaws and weakening amendments, the HBA is now largely ineffective and ironically, has become the greatest deterrent to local billboard removal efforts.

Under the current law, fewer and fewer nonconforming billboards are being taken down along our federally-aided highways. According to the Federal Highway Administration's Annual Statistical Report, nationwide, only 2,657 nonconforming billboards were removed along our federally-aided highways from FY 1986 to FY 1988. The numbers are even more dramatic for FY 1990 -- during the last fiscal year, only 226 nonconforming billboards were removed along the federal highway system.

When these number are compared to the number of billboards going up, a clear picture emerges. The Congressional Research Service estimates in a report dated January 28, 1991 (#91-115E) that there are a minimum of 425,000 to 450,000 conforming, nonconforming and illegal billboards along interstates and federal highways. This same report estimates that in FY 1986, there were 241,608 conforming and nonconforming grandfathered billboards along the federally aided highways and that by FY 1988, the number of conforming and nonconforming grandfathered billboards had grown to 289,227. That is an increase of more than 47,500 new billboards in just a three year period.

For the sake of clarity, these figures are for off-premise outdoor advertising structures made up of permitted poster panels, painted bulletins, and one-of-a kind spectaculars. These figures do not include Burma Shave-type signs or illegal farm produce signs or other illegal signs which have been temporarily constructed without permits.

In addition to allowing large numbers of new billboards to be constructed along federally aided highways, the existing Highway Beautification Act ties the hands of local public officials wishing

to use their own local land use authority to remove billboards along federal highways traversing their communities.

Prior to 1978, local officials could remove billboards along federally-aided highways by either paying cash for the signs (pursuant to the HBA) or by amortizing the billboards (pursuant to their own local laws and land use authority).

Despite billboard industry claims that amortization actions violate the 5th amendment of the Constitution, no federal appeals court has ever found amortization to be a taking in violation of the Fifth Amendment of the Constitution.

Most recently, just last week, on April 9, 1991 the Fourth Circuit Court of Appeals reaffirmed its previous holdings on the constitutionality of the amortization process. In an unpublished opinion on Major Media of the Southeast v City of Raleigh #89-1571 (4th Cir., April 9, 1991) the Fourth Circuit held that the district court correctly found that neither the facts nor the law had sufficiently changed "to warrant relief from the 1985 judgement." In its 1985 judgement, the court upheld Raleigh's 5 1/2 year amortization period.

This new reaffirmation of the courts earlier ruling clearly refutes claims that the courts have backed away from the 1985 Fourth Circuit Court ruling. The new unpublished report is attached to this statement, as is a legal memo prepared by the Southern Environmental Law Center, and a February 6, 1991 General Accounting Office Report on amortization prepared for the Honorable John Chafee.

It has been suggested that placing a moratorium on the erection of new billboards along interstates and federal primary aid highways would unfairly single out the billboard industry. A moratorium on new billboard construction -- such as the moratorium included in H.R. 1344 -- would affect only about 7 percent of the roads in America. The outdoor advertising industry would be free to construct billboards, pursuant to local or state laws, on the vast majority of the remaining roads in America.

I wish to emphasize that the Visual Pollution Control Act of 1991 accomplishes three primary objectives.

1) H.R. 1344 places a moratorium on the construction of new billboards along federally-aided highways. In the same way in which the federal government sets minimum air quality and water quality threshold, this legislation establishes a minimum visual quality threshold for the nation.

2) H.R. 1344 restores local control over billboard removal. This bill allows states and local governments to remove billboards

pursuant to local law -- either by using amortization or cash. H.R. 1344 does not require the removal of a single legally erected billboard. Billboard removal is left completely to the discretion of state and local governments.

3) H.R. 1344 prohibits the cutting or destruction of trees and other vegetation on the public rights-of-way for the sole purpose of improved billboard visibility.

Finally, in closing, I also wish to emphasize Scenic America's strong support for the comprehensive transportation proposals presented by the Surface Transportation Policy Project, the Campaign for New Transportation Priorities, and the Livable Communities Coalition. The recommendations included in the proposals developed by each of these coalitions would provide for greater flexibility in spending limited federal transportation dollars. The recommended program changes would also significantly strengthen transportation planning in this country and lead to land use patterns which would sustain a truely multi-modal transportation system.

Again, I appreciate the opportunity to present this statement to the Subcommittee and invite any questions or comments you may have. Thank you.

MEMORANDUM

To: Interested Congressional Staff

From: Katherine E. Slaughter, Staff Attorney KS

Re: Constitutionality of Amortization Provisions

Date: April 11, 1991

The billboard industry has argued that any amendment to the Highway Beautification Act that deletes the "just compensation" clause would violate the Fifth Amendment to the Constitution. However, case law does not support this assertion, as pointed out in the recent Comptroller General's "Analysis of Billboard Amortization Case Law." The following memorandum discusses additional cases by the Supreme Court, federal courts of appeals, and state courts. Some of these have been erroneously cited by the billboard industry as supporting its position that amortization is unconstitutional. These cases are summarized below, and the opinions are available on request.

Introduction

When more restrictive zoning laws are enacted, local governments are faced with the decision of whether to terminate existing land uses that do not comply with the new restrictions or to allow them to continue indefinitely as nonconforming uses that are "grandfathered." An amortization period allows continuation of an use for a given number of years and thus provides a compromise between immediate cessation and perpetual grandfathering. Although billboard companies typically claim that amortization unconstitutionally "takes" their property, the majority of states that have addressed the issue recognizes amortization of nonconforming uses as a valid land use tool. No federal appeals court has ever found amortization to be a taking in violation of the Fifth Amendment to the Constitution.

U.S. Constitution

The Fifth Amendment to the U.S. Constitution provides, in part, that government shall not take private property for public use without compensation. In addition to actual physical confiscation, the Supreme Court has stated that a governmental regulation could be so restrictive as to constitute a taking. However, the Court has rarely found such a regulatory taking even when a substantial property interest has been destroyed.

The Court has made clear that a regulatory action that adversely affects property does not constitute a taking provided

the action (1) serves a legitimate public purpose, and (2) does not deprive the owner of all use of the property. The Court has repeatedly upheld regulatory ordinances against takings claims even when a business has been destroyed. Goldblatt v. Hempstead, 369 U.S. 590 (1962) (ordinance prohibiting sand and gravel mining); Hadacheck v. Sabastian, 369 U.S. 394 (1915) (ordinance prohibiting brick yard within the city); and Mugler v. Kansas, 123 U.S. 623 (1887) (law prohibiting existing brewery).

The Court has also addressed the takings issue in a number of recent cases. In Keystone Bituminous Coal Assn. v. deBenedictis, 107 S.Ct. 1232 (1987), the Court rejected a takings challenge to Pennsylvania's Subsidence Act that forbade the mining of coal beneath certain structures in order to provide surface support. The Court found that the state law did not constitute a taking even though it undeniably prevented the most profitable use of the property.

The Supreme Court's decision in Andrus v. Allard, 444 U.S. 51 (1979), is apt to the discussion of the effect of amortization on billboards. Andrus addresses the takings issue in relation to restrictions on personal property used for business. In this case, the Department of Interior promulgated regulations that prohibited the sale or purchase of protected birds or bird parts, including those acquired before the enactment of the federal statutes protecting such birds.

Appellees traded in Indian artifacts partially consisting of feathers of protected birds and therefore argued that the regulations unlawfully took their business property. The Court unanimously rejected the takings claim and said "The regulations challenged here do not compel surrender of the artifacts, and there is no physical invasion or restraint upon them . . . loss of future profits -- unaccompanied by any physical property restriction -- provides a slender reed upon which to rest a takings claim." Id. at 65-66.

Other Supreme Court cases cited by the billboard industry as support for the contention that amortization constitutes an unconstitutional taking are not relevant to amortization provisions of sign ordinances. For example, in Hodel v. Irving, 107 S.Ct. 2076 (1987), the Court held that a taking occurred when the Indian Land Consolidation Act abolished certain fractional interests in land that had been passed to heirs at the time of death.

In First English Evangelical Lutheran Church of Glendale v. Los Angeles County, 482 U.S. 304 (1987), the Supreme Court ruled that if a taking had occurred, even for a temporary period, compensation would be due. In that case, the church operated a campground on land destroyed by flood. In response to the flood, the county passed an interim ordinance prohibiting construction or reconstruction on the floodplain. The church sued for damages on the grounds that the ordinance violated the Fifth Amendment.

The Court found that "we . . . have no occasion to decide whether the ordinance at issue actually denied [claimant] all use of its property . . .." Id. at 2384. (Emphasis added.) On remand, the lower court found there had been no taking.

In Nollan v. Calif. Coastal Commission, 483 U.S. 825 (1987), the Court reasoned that an involuntary, uncompensated conveyance of an easement violated the Fifth Amendment. The California Commission had conditioned the issuance of a coastal permit on the allowance of a public easement across a portion of private property. The Court found the constitutional defect was the lack of nexus between the condition -- the easement -- and the purpose of the coastal building restrictions -- visual and psychological access to the beach. The court explained that permissible conditions in this context might have been height or width limitations, or even a viewing spot on the land. A strip of land providing continuous access, on the other hand, constituted a taking.

While the Supreme Court has never directly addressed the amortization issue, petitions to review billboard amortization periods have been denied by the Court on a number of occasions. See, for example, Major Media v. City of Raleigh, 792 F.2d 1269 (4th Cir. 1986), cert. denied, 479 U.S. 1102 (1987); Art Neon Co. v. City and County of Denver, 488 F.2d 118, (10th Cir. 1973), cert. denied, 417 U.S. 932 (1974); E.B. Elliott Advertising Co. v. Metropolitan Dade County, 425 F.2d 1141 (5th Cir.), cert. denied, 400 U.S. 805 (1970); Donrey Communications v. City of Fayetteville, 280 Ark., 408, 660 S.W.2d (1983), cert. denied, 466 U.S. 959 (1984); Modjeska Sign Studies, Inc. v. Berle, 433 N.Y.2d 468, 373 N.E.2d 255 (1977), appeal dismissed, 439 U.S. 809 (1978).

Other Federal Courts

The takings issue has been litigated in several billboard cases in the U.S. Court of Appeals for the Fourth Circuit. In Major Media of the Southeast v. City of Raleigh, 792 F. 2d 1269 (4th Cir. 1986), cert. denied, 479 U.S. 1102 (1987), the court affirmed the district court's decision that a sign ordinance with a 5 1/2 year amortization period was not a taking on the grounds that the period permitted recoupment of a portion of the sign owner's investment. The court recently reaffirmed this ruling in an unpublished opinion, Major Media of the Southeast v. City of Raleigh, #89-1571 (4th Cir. April 9, 1991). The Fourth Circuit ruled that the district court correctly found that neither the facts nor the law had sufficiently changed "to warrant relief from the 1985 judgment." Id. at 3. It thus rejected the billboard company's assertion that Durham, discussed below, represented a change in the law.

In Naegele Outdoor Advertising Co. v. City of Durham, 844 F.2d 172 (4th Cir. 1988), the court of appeals sent the case back to the district court with instructions for development of the

facts. Further factfinding has occurred, motions for Summary Judgment have been filed, and at this writing the parties are awaiting a hearing by the district court.

In Georgia Outdoor v. City of Waynesville, 900 F.2d 783 (4th Cir. 1990), the court of appeals overturned the ruling of another district court that the Waynesville ordinance constituted a taking. The court sent the case back to the district court for further factfinding. The parties in Waynesville are in the process of discovery with a trial date set for June 1991. In its opinion, the court of appeals maintained that Raleigh and Durham were not inconsistent but, instead, that the Durham record had disclosed issues about material facts needing resolution in the district court.

State Cases

Other recent cases from state courts cited by the billboard industry do not involve the federal constitutional takings issue. In Penn Northwestern Distributors v. Township of Moon, No. 89 W.D. (Pa. Sup. Ct. January 7, 1991), a divided court agreed that a 90-day amortization period for an adult bookstore was inappropriate. The majority opinion held that under the Pennsylvania constitution (not the U.S. Constitution), the owner of a grandfathered use had a vested right that could not be removed. Three other justices in two separate opinions concurred in the result on the grounds that the brevity of the amortization period, not the state constitution, made it invalid.

Likewise, in Lamar Advertising v. City of Albany, ___ GA ___, 389 SE2d 216 (1990), the court found that the amortization period violated the takings clause of the Georgia constitution, which states that private property may not be taken "or damaged for public purposes." Id. at 217. By contrast, the federal Constitution states that private property shall not "be taken for public use, without just compensation." The federal constitutional issue was not addressed in Albany.

Fort Collins v. Root Outdoor Advertising, ____ Colo. ____, 788 P.2d 149 (Colo. 1990) deals with interpretation of the Highway Beautification Act and the corresponding state law. The court held that the city could not remove grandfathered signs adjacent to the federal highways without "just compensation." The court found Congress had made a "conscious political decision to reject the use of amortization provisions to comply with the federal act" and that cash compensation was required. Id. at 155. No constitutional issue, state or federal, was addressed.

In addition, there are a number of other state and federal cases, not discussed here, that uphold amortization as a lawful, constitutional means for terminating nonconforming uses, such as billboards.

# REAUTHORIZATION OF SURFACE TRANSPORTATION PROGRAMS

MONDAY, APRIL 22, 1991

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON SURFACE TRANSPORTATION,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
*Fort Smith, AR.*

The Subcommittee met, pursuant to call, at 9:00 a.m., in the Holiday Inn Civic Center, 700 Rogers Avenue, Hot Springs/St. Louis Room, Fort Smith, Arkansas, Hon. Norman Y. Mineta (Chairman of the subcommittee) presiding.

Present: Representatives Mineta, Hammerschmidt, Rahall, Shuster, Hancock, Cramer, Nichols, Zeliff, and Molinari.

Mr. MINETA. The Subcommittee on Surface Transportation will please come to order. We are pleased to have this opportunity to hold this meeting here in Fort Smith and also with the great hospitality that everyone has shown to—in terms of their courtesies to the subcommittee. I want to thank everyone very much.

It is a great pleasure for us to all be here in the 3rd Congressional District in Arkansas.

Arkansas is well represented, especially the 3rd Congressional District, by Congressman John Paul Hammerschmidt. He really represents all of Arkansas. We admire him, and we respect him. So many members are here to see the 3rd district. The northwest part of Arkansas seems to thrive on this entrepreneurial spirit that so many of you show.

The Ozarks serve as a breathtaking backdrop for this regional hearing.

As all of you know, John Paul Hammerschmidt is one of the finest Members of the House of Representatives. All of us are looking forward to working with him as a leader on the Public Works and Transportation Committee. His commitment and dedication to the issues that face the people of Arkansas, the people of this nation, the people of the 3rd Congressional District is commendable.

This year, we have a chance to craft legislation which is visionary. None of us are really interested in just addressing the issues as the reauthorization of another highway bill. We are trying to look at transportation as a system and what are our wants and needs in the 1990's as we prepare for the 21st Century. We are still determining the specifics of the legislation.

I know that there are five general principles around which we will put this legislation together. First of all, what will this legisla-

tion do to help in terms of international competitiveness? We know that there is a great deal of relationship between investment and transportation infrastructure and productivity. What will this legislation do to help us be players in the international global marketplace?

Second, what will this legislation do to help us in terms of state and local economic development?

Third, what will this legislation do to help us in terms of quality of life?

Fourth, what will this legislation do to help us in terms of public safety?

And fifth, what will this legislation do to help us in terms of providing consistent, stable and flexible sources of funding?

Now, our transportation network will only truly improve in the years ahead if we put out increasingly scarce federal dollars where the needs are today and where they must be in the future. That kind of foresight demands not a single strategy, but a series of policies that will be responsive to state, regional and local needs, well into the next century. We will be hearing from some of Arkansas' experts on a wide variety of important transportation issues today.

I look forward to hearing the testimony of today's witnesses, for your insights on these issues will be very helpful as we continue to formulate our Committee legislation.

At this point, I would like to yield to our very distinguished colleague from the 3rd Congressional District of Arkansas, the ranking Republican on the full committee of the House Public Works and Transportation Committee. This committee is really a very bipartisan committee. There are no Democratic bridges or Republican highways. These are roads and highways that really benefit all American people without concern to ideology or partisanship. And foremost in that leadership element in making sure that it remains bipartisan is none other than Congressman John Paul Hammerschmidt, a very distinguished member of the House and a person we all admire and love very, very much. At this time, I am pleased to yield to our very fine colleague, Congressman Hammerschmidt. John Paul.

Mr. HAMMERSCHMIDT. Thank you, very much, Mr. Chairman. I greatly appreciate those very kind and generous remarks. It is a distinct pleasure for me to welcome you and all of our committee colleagues to Fort Smith for this hearing. You know, some in our audience had the opportunity to meet the members of the subcommittee at last night's reception and the dinner arranged by the Fort Smith Chamber of Commerce. However, Mr. Chairman, I know we are anxious to hear our witnesses, but I would like to formally introduce my colleagues at this time.

First of all, we are extremely fortunate to have with us the man you just heard, our very able and dynamic Surface Transportation Subcommittee Chairman, Norm Mineta of San Jose, California. I dare say that no one knows more about the work of our committee than Norm Mineta. With over a decade and a half of service in the Congress and on the committee, he has chaired four of our six subcommittees. Before taking the Chairmanship of this Subcommittee, he chaired our important Aviation Subcommittee for four years. Chairman Mineta has provided great leadership in scheduling this

important and very extensive set of hearings on the development of the next highway and transit legislation.

Now, the other half of our great Subcommittee leadership team is Congressman Bud Shuster of Everett, Pennsylvania. Congressman Shuster has been the extremely effective ranking member of our Surface Transportation Subcommittee for the past 15 years. During that time, he has made enormous contributions to the nation's highway program, and nobody has greater expertise on the issue of surface transportation than Bud Shuster. Once again, he will play a leading role in the development of the next highway legislation.

Congressman Nick Joe Rahall of Beckley, West Virginia is one of the Committee's most able and senior members of both the full Committee and Surface Transportation Subcommittee. He also serves on our Economic Development Subcommittee. In addition to his service with our committee, Congressman Rahall is Chairman of the Mining and Natural Resources Subcommittee of the House Interior and Insular Affairs Committee.

Congressman Mel Hancock hails from Springfield, Missouri. His district borders the third district on the north. We share part of the Ozarks and a number of mutual interests, including the upgrading of Highway 71 in both Arkansas and Missouri. Congressman Hancock serves with great distinction on our Aviation and Water Resources Subcommittees.

Congresswoman Susan Molinari is our very fine member from Staten Island, New York. She followed in the tradition of her distinguished father, Congressman Guy Molinari, who also served on this committee. Susan is a member of our Aviation, Water Resources and Investigations and Oversight Subcommittees.

Congressman Bud Cramer is our very effective member from Huntsville, Alabama. He serves on our Surface Transportation, Economic Development and Water Resources Subcommittees.

Congressman Dick Nichols of McPherson, Kansas is a valuable member of our Surface Transportation and our Aviation Subcommittees.

And finally, Congressman Bill Zeliff is from Jackson, New Hampshire. He serves very capably as a member of our Surface Transportation and Water Resources Subcommittee.

And I know that I speak for all my fellow Arkansans when I say how very pleased we are to have these very distinguished Members of Congress here today. I look forward to some very enlightening, useful testimony as part of what I know will be a very productive hearing.

Again, Mr. Chairman, I want to commend you for scheduling the Subcommittee's very important series of field hearings on the reauthorization of our federal highway and transit programs. I am especially pleased that you have scheduled today's hearings in Fort Smith. And as you said, this is the last of five field hearings. The committee had planned to do this last October, but Congress convened for an unusual weekend. We were in session on Saturday and Sunday that particular weekend, and we were trying to reach an agreement on the budget last October, and that forced us to postpone that Fort Smith hearing. So, here we are today.

But rescheduling this hearing, I think was important because I believe that what we will learn today will be of great benefit to the Committee as we move forward in the drafting process on new highway transit and highway safety legislation that will shape these programs well into the next century.

You know, I suggested that the subcommittee come to Fort Smith, here in the heart of western Arkansas, because I felt it would provide an ideal forum to discuss the needs and problems in this high growth, largely rural region of our country where major industrial, commercial and commuter traffic is placing a heavy burden on the area's highways. And of course, highways are of critical importance to the Fort Smith area. This is a western Arkansas primary industrial center—a major center for truck transportation. In addition, it has become a major tourist recreation center as well. Its proximity to Interstate 40 has played a significant role in the booming growth that has taken place.

However, the interstate, as it was conceived in the mid-1950's, does not adequately serve the needs of all the major population centers in the 1990's, including western Arkansas. That is why we need the Highway 412 corridor, the proposed east/west four-lane route that crosses the northern part of Arkansas and that is why we need to upgrade the Highway 71 corridor, both north and south of Fort Smith. The planned north/south corridor may one day link Kansas City, Missouri to Shreveport, Louisiana an interstate standard north/south route will be extremely beneficial to the cities and the towns along this corridor.

Mr. Chairman, I have a rather comprehensive statement, and we are anxious to hear our witnesses so I would ask unanimous consent that I place my entire statement in the record. Let me just say once again that I want to welcome all of our congressional colleagues and all of our distinguished witnesses and guests. I look forward to a very productive hearing, Mr. Chairman.

Mr. MINETA. Thank you very much, and without objection, your full statement will be made a part of the record.

At this time, I would like to yield to our very fine ranking Republican on the subcommittee, the gentleman from Pennsylvania, Congressman Bud Shuster. Bud.

Mr. SHUSTER. Thank you very much, Mr. Chairman. It is wonderful to be here in John Paul Hammerschmidt's district. Someone asked me earlier this morning how I got here since I was unable to catch the Air Force plane yesterday morning and commented that it took some flying and some driving and some flying. But I said the short answer was that I would have walked here for John Paul Hammerschmidt if necessary because he is just that highly regarded—indeed, revered, in the Congress of the United States. So, I am pleased to be here for these very important wrap-up hearings which our Subcommittee has been holding over the past year and a half as we proceed to writing what many of us believe should be and will be an historic transportation bill this year which will carry America into the 21st Century. Thank you.

Mr. MINETA. Mr. Rahall.

Mr. RAHALL. Thank you, Mr. Chairman. Mr. Chairman, Congressman John Paul Hammerschmidt mentioned that he suggested the Subcommittee come here to his district in Arkansas to have

this wrap-up hearing. By the turnout of our colleagues here, I would say that Congressman John Paul Hammerschmidt's suggestions in Washington carry much more weight than many others' commands. We have more members here probably than we have at many hearings in our nation's Capitol.

Inside the beltway, we have an expression known as "we ask unanimous consent to revise and extend one's remarks". That is a quick way of saying, we would like to get to hear our witnesses, and that is what I am going to do at this point so that we can hear those that have come from around this area in Arkansas to appear before us. Thank you.

Mr. MINETA. Without objection, the gentleman's full statement will be entered into the record. Mr. Hancock.

[Mr. Rahall's prepared statement follows:]

STATEMENT OF HON. NICK J. RAHALL II, DEMOCRAT OF WEST VIRGINIA, HEARING, SUBCOMMITTEE ON SURFACE TRANSPORTATION, FORT SMITH, AR

Chairman Mineta, Congressman Hammerschmidt, thank you both for holding this hearing on the reauthorization of the surface transportation programs, and for inviting me back to Arkansas. It is always a pleasure to visit your fine State, Congressman Hammerschmidt. As I noted during my last visit, Arkansas is a predominantly rural State much like West Virginia, and I feel right at home.

I understand that we have a panel of witnesses representing transit interests. Ms. Anne Henderson, Director of the Arkansas Transit Association, and Tanya Kopke, Director of the Arkansas Transit System of section 18 agencies.

I hope to exact from both of you an endorsement of H.R. 1079, the mobility assistance bill which I have introduced. As you know, Mr. Chairman, my bill increases funding for rural and small urbanized areas. For rural areas, funding would go from 2.93 percent to 7.5 percent, and for small urbanized areas it would rise from 8.64 percent to 10 percent.

If you ask me why it is necessary to increase transit funding for rural and small urbanized areas, I would simply tell you that the percentages for allocation of these funds were set back in 1978, and this is 1991. Thirteen years is a long time to go without anyone paying attention to the fact that it isn't meeting the public demand for transit services.

No one is more desirous than I am to obtain additional funding for highway projects. God knows the whole country is relying on us to help it meet massive transportation and economic development infrastructure needs. But if anyone in this room thinks economic development can be expanded on and improved without public transit services, they've got another thought coming. Economic development means moving commerce and people, not just commerce.

Briefly I would like to say a word about my bill, known as the Mobility Assistance Act which will assist all transit dependent individuals who live in remote, and often isolated areas of our rural countryside. In addition to increasing the funding setasides for rural and small urbanized areas, it pays particular attention to assisting the elderly through coordination of services available to them from other Federal social services and those under my bill, and it also focuses on providing capital assistance for meeting transit requirements under the Americans With Disabilities Act.

My bill has 36 cosponsors, Mr. Chairman, 12 of whom are on the Subcommittee on Surface Transportation, and who also have rural congressional districts.

There are transit authorities throughout rural America who can only guarantee bus services for 1 or 2 days a week. That doesn't help rural individuals who have jobs they need to get to 5 days a week.

When we passed the Americans With Disabilities Act, we held out the promise above all other promises that the handicapped would be enabled to travel to and from jobs themselves—one of their greatest deprivations before the act was passed was access to public transit. That promise won't be worth the paper it's written on if we don't help transit authorities meet those mandates in the "A.D.A." law.

For the elderly, especially the frail elderly who are more dependent on public transit than most people—they can't even be assured that a bus will run on the day they have a doctor's appointment, and certainly few of them can hope to visit their Senior Center every day for the one hot meal they can receive through the Older

Americans Act senior nutrition programs. We heard testimony in Washington, Mr. Chairman, to the effect that many paratransit providers can no longer deliver meals on wheels to elderly citizens because of a lack of funds.

Low income individuals, a majority of whom live in rural areas according to recent statistics, who have to commute to nearby cities and towns in order to get to work every day, cannot get to that job if a bus only runs twice a week. If the able-bodied can't depend on transit in rural areas, imagine then, the problems encountered by the disabled worker or the elderly and frail, without public transit.

I won't go into further details on the Mobility Assistance Act, except to say that it is garnering more and more support as the days go by, and it is our chance to begin to change priorities established for transit services back in 1978. As I said earlier, this is 1991—and it is time to recognize, and then do something about, rural and small area transit funding needs.

Just talking about rural and small urban transit needs won't get it. We have to get some action, and with a 5 year bill looming before us, now is our only chance to begin to ready public transit for the 21st century.

Thank you Mr. Chairman. And I want it carefully noted that I have kept my promise not to mention flexibility!

Mr. HANCOCK. Thank you, Mr. Chairman. It is a real pleasure to be here today to look at some of the specific needs of the area as we continue the process of authorizing post interstate surface transportation programs.

Last year, we held a similar meeting in my district, which is just over the Arkansas line in Missouri. It was an extremely valuable meeting which helped me and the committee better understand the needs that exist out in America, instead of looking at the problem from a committee room in Washington, DC. I commend Chairman Mineta and John Paul Hammerschmidt for continuing to hold these informative hearings throughout the country.

Today, we will be receiving testimony from two very important businesses in my district who transport goods through this area mostly on Highway 71. Due to the close proximity of my district to this area, I feel it is important to hear how road conditions and capacity expansion in this region affect the economy of southwest Missouri.

A little later, Charlie Mudd, the Vice President of Operations for Contract Freighters will tell us how important maintaining a strong surface infrastructure in this area is to his business. But first, Mr. Chairman, I ask unanimous consent that the statement of Dr. Lance Beshore, the staff Vice President for Public Affairs and Government Relations of Leggett & Platt, Inc. be included in the record. (See page 2407.)

Mr. MINETA. Without objection.

Mr. HANCOCK. Dr. Beshore, who was scheduled to testify at this hearing last year before it was canceled due to the budget mess, cannot be here today because of a scheduling conflict. While Mr. Mudd will discuss the importance of good roads in the transportation industry, Dr. Beshore's testimony addresses their effect on a major corporation. Leggett & Platt is a Fortune 500 company which employs 12,000 people throughout the U.S. and Canada. It is a components manufacturing company with annualized sales of above a billion dollars. Certainly, their interest in maintaining and expanding shipping routes is paramount and is reflected in his statement.

I thank you, Mr. Chairman, and I look forward to hearing from the witnesses today.

Mr. MINETA. Mr. Cramer.

Mr. CRAMER. Thank you, Mr. Chairman. And thank you, Mr. Hammerschmidt, for the wonderful hospitality that this community has shown to us. I feel like I am in a roomful of new friends and I enjoy that. I think it is important—I am a new member of Congress and I think it is very important for us to leave our environment there in Washington occasionally and come out here into the field and to see what impact some of our pieces of legislation may have upon all communities.

I am honored to have a large group from my home town, Huntsville, Alabama, the 5th Congressional District of Alabama, which is north Alabama—right across the top of Alabama—that are here to also testify about a road issue that is important to our area. Huntsville is a growth area in Alabama. The 5th District is a growth area, and we were left out of the design of the interstate system back in the 50's. So we, too, are interested in improving our roads.

So, Mr. Chairman, I thank you for holding this hearing and look forward to the testimony that will be offered today.

[Mr. Cramer's prepared statement follows:]

STATEMENT OF HON. BUD CRAMER, A REPRESENTATIVE IN CONGRESS FROM ALABAMA

Mr. Chairman, I look forward to today's hearing. I believe it is integral to our work to leave Washington and visit the areas our actions will affect. I thank the distinguished gentleman from Fort Smith, Mr. Hammerschmidt, for his hospitality and the hospitality of his neighbors.

Our committee has an arduous and challenging task before us as we review our transportation policy and make needed adjustments and improvements. It has been said in this committee time and time again, and is worth repeating, "when we strengthen our core infrastructure—we enhance a community's quality of living which increases the opportunity for economic growth."

This is, and should be, our guiding principle. Our committee has listened to business persons explain in detail issues that are adversely affecting us on a global scale. These issues include health care costs, environmental concerns, asymmetrical trade openness and the like. One continuing theme that came from our discussions was that we have to strengthen our core infrastructure—that is we need better accessibility to urban and industrial centers, we need to assist small communities improve wastewater treatment facilities, and we need to assist local communities financially in alleviating educational and health care concerns.

For many of the Southern States, Mr. Chairman, there is a need—a drastic need—for highway improvement. Many of our roads are simply unsafe after years of wear and tear. Even with this problem and in spite of this problem, areas like Huntsville, Decatur, Florence, Muscle Shoals, and Scottsboro have seen economic strides. We can only imagine what we could provide to the country if we had a better roadway that connects us with major centers to the East and to the West.

Mr. Chairman, I honestly feel that if we do not include the construction and reconstruction of a highway that connects Memphis to Atlanta in this year's reauthorization bill the northern 60 percent of Mississippi, 40 percent of north Alabama and 30 percent of Georgia above Atlanta will enter the 21st century unserved by an East/West highway of national significance/importance. The only interstate serving north Alabama and north Mississippi today is I-65 from Birmingham to Nashville. It does not provide a connector to a single city.

Mr. Chairman, it appears to me that an inequity will exist in our transportation policy if we move forward to a "post-interstate era" and leave unaddressed the needs I have outlined. How can my district continue to compete efficiently if companies find difficulty moving goods in and out of my district. We are not arguing for special privileges. We are only saying that we have been left out of the interstate system and have over the years worked with what we had. But as we move toward the 21st century, as the concept of intermodality takes a more concrete form, it is imperative that this committee and the administration take into consideration what these four states have offered and what we can offer to this country.

Mr. Chairman, I support using all of the highway trust fund money for highway construction, reconstruction and improvement. The northern portions of Alabama, Georgia and Mississippi have contributed to the highway trust fund for 35 years.

Isn't it only fair that those who readily contribute to the trust fund, those who are the stated beneficiaries become the actual recipients of those funds so that we can build this corridor route that will help the stream of commerce and strengthen the work of the major government installations located in the area. These major Government installations include the Marshall Space Flight Center, the advanced solid rocket motor facility, the Army Missile Command, the Army Ordinance Missile and Munitions Center and School, the Army Strategic Defense Command, the Army Corps of Engineers and the Tennessee Valley Authority.

Our national transportation policy should carefully take into consideration areas that are experiencing growth and should be shaped to enhance that growth. Cultivating a healthy economic environment not only will make us more competitive internationally, it will also provide us with the wherewithal to address national issues like infant mortality, health care for the elderly and nutrition programs for children.

Mr. Chairman, I thank you for convening this hearing in a timely manner and for allowing the mayor of my hometown, the Honorable Steven Hettinger to testify. Because of your background in municipal government, I am sure you will understand and empathize with Steve's statement.

I look forward to today's testimony.

Mr. MINETA. Ms. Molinari.

Ms. MOLINARI. Thank you, Mr. Chairman. I do not think I have got any constituents in this room. I wish I did. I represent the city of New York, and it has been very educational and inspirational for me to come back to an important part of America and see the spirit that is still alive here, a spirit that will guarantee that our future in this country is as proud as our past. And sometimes in our urban areas, and especially lately, we have lost a little bit of sight of that.

But the dedication and commitment that I have seen in this room and the people that we have met has just been very inspiring and challenging to me. And that has increased my dedication to work with this committee because clearly, we are so connected both from an ability to transmit our hopes to the urban areas—to also transmit our goods to the urban areas. And if we can keep areas like this in our country, those areas that are growing, that have hope for the future positive, we know that our cities will survive.

So, I feel much better about the area that I am privileged to represent by coming here across the country and seeing just what positive individuals and business and needs that this area has. I look forward to working with people like the Chairman. And as everyone has said here, while it has been an honor to meet the people in Arkansas, most of us would follow John Paul Hammerschmidt to the ends of the earth if he asked us to because he is just that great an individual, and it is a privilege to serve with him and it has been a delight to meet all of you.

So, I look forward to hearing your testimony and making your dreams for this area a reality.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Nichols.

Mr. NICHOLS. Chairman Mineta, thank you very much. Ladies and gentlemen, what a pleasure it is for me to be here with Chairman Mineta and this Committee and follow the leadership of John Paul Hammerschmidt.

Many of us have been to Arkansas before and admire your spirit of cooperation, your zeal, your belief, your enthusiasm and your hospitality. I think what impresses me most of all again on this

visit is the way all of you cooperate and work together at all levels of government, and that is the story of success. And that is the story of mutually building on something that you have got here, your great natural resources to move this project forward.

I come from Kansas. We are recognizing the importance of good highway programs. We want to have highways feeding into the Mid-America district, and we are anxious to have people like Susan Molinari from Staten Island come here and view what is the area of growth for the future.

So, we want to salute you above all for your extreme hospitality, your cooperation. We look forward to the hearing.

Mr. MINETA. Mr. Zeliff.

Mr. ZELIFF. Thank you, Mr. Chairman. I, too, would like to mention—even though New Hampshire is a little bit further away—that I, too, would walk in the footsteps and follow John Paul anywhere.

I was privileged to be here 30 years ago as a Private E2 in the Army at Fort Chaffee and spent a lot of time at Fort Smith and Hot Springs and Little Rock and Fayetteville. [Laughter.]

You have a wonderful state. As a matter of fact, I almost feel like I am in New Hampshire because of your natural resources, the rural area and the natural beauty that you all have—your work ethic. You have got it all together and enjoy it. I am a business guy for the last 32 years. I am a freshman and particularly happy to be among Chamber of Commerce people and the public and private sector of participation that all of you have shown and the hospitality.

Most important, you have a rural area with rural needs. We hear so much from cities and big states and all the big guys. We have got to hear from you and we have got to hear from New Hampshire as well. So, I am looking forward to your testimony and it is a real pleasure to be here in John Paul's district.

Mr. MINETA. Thank you very much. As Mr. Zeliff just mentioned, the cooperation between the public and private sector is very, very important. And this morning, we have a very distinguished first panel made up of Mr. Ed Warmack, President, Warmack and Company; Ross Pendergraft, Executive Vice President and Chief Operating Officer, Donrey Media Group and Mr. H. L. Hembree, Manager, Sugar Hill Partners.

And we are pleased to have all of you here with us this morning, and all of your statements will be made a part of the record. And so, if you would go ahead and give us your abbreviated version orally, we would appreciate it very much.

Mr. Warmack, I guess is the leadoff witness. Mr. Warmack.

## TESTIMONY OF ED WARMACK, PRESIDENT, WARMACK & CO.; ROSS PENDERGRAFT, EXECUTIVE VICE PRESIDENT AND CHIEF OPERATING OFFICER, DONREY MEDIA GROUP; AND H.L. HEMBREE, MANAGER, SUGAR HILL PARTNERS

Mr. WARMACK. Chairman Mineta, Committee members and friends. A friend of one of my sons was pursuing employment. His first prerequisite was that the work calendar not include Friday and Saturday. Thanks to all of you for giving up your weekend to

be here in Fort Smith, Arkansas. John Paul continues to be of the "old school" and spends most of his weekends here in western Arkansas with his friends working. You know he does not have any enemies.

Some hundred years ago, our city's fathers tried, to no avail, to negotiate Fort Smith becoming a part of the Rock Island Railroad east-west arm between Memphis, Little Rock, Oklahoma City, Amarillo, Tucumcari, New Mexico and points west, with Fort Smith also being on the main line of the Kansas City Southern Railroad operating between Port Arthur, Beaumont, Shreveport, Texarkana, Fort Smith and Kansas City. Also, a division point was suggested for these railroads for Fort Smith.

With the city losing these two main lines, it is impossible to measure the amount of growth Fort Smith missed by not having these two advantages. We appreciate your Committee's approval of the Waldron Road project and solicit your consideration and help on the Phoenix Avenue extension project. We are most thankful to have Interstate 40 and 540, both having given relief to our local, as well as our through traffic.

We hope funds will be set aside for the construction of Interstate 49, or Mid-America Artery, as it possibly will be called, during the next allocation of funds for interstate road systems—north from Houston/New Orleans through Texarkana/Fort Smith, Kansas City and, of course, on to the Canadian line, which would give Fort Smith, Arkansas a tremendous boost. If funds are not available in the foreseeable future and your Committee feels that funds will be more readily available for this artery to be a toll road similar to those in Oklahoma, we would consider it a favor for you to advise us in order that we may expedite our requests for this to be a toll road.

Central Mall, the largest shopping complex in the state of Arkansas, was built in 1970. It continues to be a primary shopping facility in western Arkansas and eastern Oklahoma. There is no question that Fort Smith would become a larger retail market with the completion of the north/south interstate.

May we also call your attention to the fact that additional tourism would be generated, as well as added safety and quality of life.

Today, Fort Smith's household count is 28,200. With more than 85,000 people—that is hard for me to believe, but that is the figures that we have—more than 85,000 people coming to their jobs in Fort Smith every normal working day, and more than half of these from outside of Fort Smith, which creates congestion on our road systems.

During the first half of this century, the railroad main lines made that tremendous difference. Today, interstate road systems make that tremendous difference. Any improvement made in our road system would be most appreciated. We hope our highway needs and street requests are given favorable consideration. And again, I want to say thanks to you all for being here today and for all the help you have given us in the past.

Mr. MINETA. Thank you very much, Mr. Warmack.

Mr. Pendergraft.

Mr. PENDERGRAFT. Chairman Mineta, Congressman Hammerschmidt and distinguished members of this Committee. Thank you

for the opportunity to speak on behalf of the people of western Arkansas and eastern Oklahoma.

In 1975, the U.S. Department of Commerce predicted the next growth pattern for this nation. It said the cities of the 21st Century will be intermediate population centers of under 100,000 population with surface, air, rail and water transportation located within one day's truck travel of such major distribution points like Dallas, St. Louis, Memphis and Chicago. Additionally, these new American cities would have an abundant supply of low-cost energy, such as natural gas. The description totally fit only one American city in 1975, and that was Fort Smith, Arkansas.

Now, I invite your attention to what actually transpired during the past 15 years—from Knoxville, Tennessee to Nashville to Memphis to Little Rock to Fort Smith to Tulsa and to Oklahoma City. At intervals of approximately 125 miles to 200 miles clear across America, intermediate population cities have boomed economically and have recorded rapid population increases, particularly in the Sun Belt and the heartland of America. This growth has occurred along the interstate system and parallels the 1975 prediction by the Department of Commerce.

Despite creation, growth and development of perhaps a dozen major truck lines in this region, including the fifth largest commercial hauler in the United States, one gap in this growth pattern stands out. That gap, of course, is U.S. Highway 71 along the western border of Arkansas that generally has been neglected in the federal highway funding. This neglect has adversely impacted the people and economics of both western Arkansas and eastern Oklahoma for three decades.

For almost 40 years, the people of this region, their per capita income, their public safety and their overall standard of living have been the victims of that oversight by Congress in the 1950's. Relying on their own self-sufficiency, location and the natural resources of this region, the people of western Arkansas have made remarkable progress in literally pulling themselves up by their bootstraps. I do not have to tell you the homegrown and national corporations that have chosen to locate along this neglected transportation corridor, primarily because of the proximity to the population center of this country. Additionally, I would be less than truthful if I did not give you part of the credit—did not give part of the credit for Fort Smith's development during the past 15 years to the federal/state partnership that produced Interstate Highway 40, our east-west lifeline to much of America.

As the publisher of more than 50 newspapers in some 20 different states, my company, like most manufacturers, depends heavily on surface transportation of materials and supplies, not to mention distribution of our finished product. To an even greater degree than most other business enterprises, we are committed to the economic development of the communities we serve. Our success or failure and the level and quality of service we provide our readers depend on advertising revenues. Those revenues rise or fall in direct relationship with the economic health and total community effort. Certainly, we have a vested interest in expanding U.S. Highway 71 to interstate quality, but so do more than a quarter million readers of the three daily newspapers situated along this corridor.

I submit to you that in addition to the immediate and desperate needs of the people of western Arkansas—the business operators, professionals and workers alike—the entire country has a stake in surface transportation in this region, particularly between the Missouri line and Texarkana, Texas. The inferior quality of U.S. Highway 71 is a national defense concern. It is the missing link in our national distribution system for goods and services.

U.S. Highway 71 is a dangerous and outdated roadway that has claimed 122 human lives in just the past 48 months in this state. Just within 30 miles north and south of this city, between 1,000 and 1,500 traffic accidents have occurred in the same period of time. And between the Missouri state line to the north and Texarkana to the south, at least 1,000 men, women and children have sustained serious injuries that required hospitalization. A new highway of interstate quality can and will significantly reduce this needless bloodshed.

Now, there is one other project that I would like to speak to you about this morning, and that project is the Phoenix Avenue project here in Fort Smith. The city of Fort Smith has requested a special appropriations in the 1991 Surface Transportation Act to help fund the critically needed Phoenix Village project—Phoenix Avenue project. The $10.5 million Waldron Road project currently under construction was funded in part by a special $6.8 million appropriation in the 1987 Surface Transportation Act, and we thank you for that. The $12 million Phoenix Avenue project would extend Phoenix Avenue east from I-540 around the Fort Smith Airport and the Arkansas National Guard, connect with the new interstate at Mazzard Road at Rogers Avenue. The 3.1 mile Phoenix Avenue project is the only viable, practical and safe east-west alternative for heavily congested Rogers Avenue.

In conclusion, I beg you to do all you can and solicit your support to give the people of this region something I believe they should have been given when the first Interstate Highway Act was enacted: an even break with the rest of America to help themselves and their country. Do that and I can assure you that the people of western Arkansas and eastern Oklahoma will not let you down. Thank you.

Mr. MINETA. Thank you very much, Mr. Pendergraft.

Mr. Hembree.

Mr. HEMBREE. Chairman Mineta, Congressman Hammerschmidt and members of the Surface Transportation Subcommittee, I would like to thank you for coming to Fort Smith for the hearing and for allowing me the opportunity to speak with you on behalf of the citizens of this area. I am H. L. Hembree, Managing Partner of Sugar Hill Partners, and I have been involved in a variety of corporations throughout this nation for over 35 years. My primary interest and basis of operation have been here in western Arkansas, and in preparing for your visit, it occurred to me that throughout this period, we have been trying to get support for a decent north/south highway system throughout this area.

I extracted the following from a publication in November 1966 that stated, "H. L. Hembree, Secretary-Treasurer of the Sebastian County/Fort Smith Area Planning Commission showed slides and spoke of the make-up of the 21-county area represented by Arkan-

sas—Western Arkansas Development Association, which is chaired by J. Fred Patton. The purpose of this group is to further develop the plans for a turnpike from the Missouri line to Louisiana, running through western Arkansas section. Louisiana and Missouri are currently working on this project, the overall goal being to build the turnpike from Kansas City to New Orleans." Ladies and gentlemen, we are gathered here today, some 25 years later, discussing this very same subject. I have to believe there is a message here. Our economic growth has far exceeded the development of our transportation network. And today, the lack of a four-lane interstate highway system along this north/south corridor is a more serious problem today than ever before.

We are not talking about just a nice four-lane highway that runs through the area. We are talking about connecting middle America and the true economic growth in all the surrounding states. Highway safety is another major factor to be considered.

At one time, truck traffic going from Houston to Shreveport came through this area. Today, all of this area—all of this goes elsewhere at a much greater cost. The Kansas City to Shreveport run was the crux of the old Arkansas Motor Freightways system. The company was actually built on the success of this run. Today, not a single schedule for this company runs between these points. Trans-State Lines, which I am associated with today, will run eight to ten schedules daily between Forth Smith and Houston. I can imagine what it would mean to have this last segment completed between Fort Smith and Texarkana. We are most appreciative of the support and progress being made on U.S. 71 to the north. But until we get this connection to the south, we will never be able to open up middle America and be able to enhance the opportunities for business and industry along this corridor.

Only last week while driving on Interstate 40 enroute to Little Rock, I noticed the marked difference between the development on it versus State Highway 22 on the other side of the river. Plain and simple, the volume of traffic has made the difference. Accordingly, when driving on Highway 71, you see decayed motels due to the lack of traffic, as well as a lack of good restaurants. This situation should not exist since there are over 45 million people living in these Mid-America states. Many of these people are actually afraid to travel Highway 71 because it is narrow, crooked and they do not want to add to the large number of fatalities that continue to occur each year on these highways. We need your help to find a way to create a program where we can get this long-awaited project underway today. The next time I testify, hopefully before this Committee, I would love to say, "Thank you, ladies and gentlemen, for a job well done." Thank you.

Mr. MINETA. Thank you very much, Mr. Hembree.

Mr. Warmack, in your testimony, you referred to the possibility of placing tolls on an upgraded U.S. Highway 71 in this north-south corridor if this would facilitate its upgrade to interstate standards. Do you believe that the use of tolls would have widespread support in western Arkansas because of the tremendous need for making improvements in this north-south corridor?

Mr. WARMACK. I feel that we would probably follow in the same footsteps that Oklahoma has. There was some objection originally,

but now, it is all accepted and people appreciate the opportunity to have interstate quality roads to use. It now exists between 40 going on into Tulsa and from there on over to 35 north/south route and some—let me see—in the early 50's, there was a toll road built between Tulsa and Oklahoma City. Originally, it was not thought it would be used, but it was not but a short time until it was used extensively, accepted and no objections to that road, as far as I know—as far as the tolls on that road, as far as I know.

Mr. MINETA. Very well.

Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. Well, I want to thank our three very distinguished witnesses. I notice that we have nine panels, Mr. Chairman, and I think I am going to forego any questions because your testimony is quite comprehensive. In the hopes that we can finish these hearings in time today, I think I will forego questions at this time. But thank you again, gentlemen, for your very helpful testimony.

Mr. MINETA. Mr. Rahall.

Mr. RAHALL. Thank you, Mr. Chairman——

Mr. MINETA. Excuse me. Before the panel runs off, let me see if any other members might have questions.

Mr. RAHALL. Let me just ask Mr. Hembree, if I might, one quick question. What do you consider to be the major factors that have been responsible for the lack of progress in making improvements to the north-south, U.S. 71, corridor 25 years after the meeting that you have referred to in your testimony?

Mr. HEMBREE. Oh, I do not know that there is a real simple single answer to it. Ross was just showing me earlier today a study made by a group that made the Oklahoma Turnpike studies years ago, and we found that we could build the whole road at that time for about $200 million between Oklahoma—I mean between Missouri and Louisiana. The big stumbling block at that time was a mountain down at Mena. I suspect the real reason that we have not been able to get an upgrade of 71 today is probably a lack of finances at probably both state and federal levels. But there are progress being made on them, but the highway is still a very dangerous highway. It is one that is just not very good for commercial transportation. And frankly, I do not like to drive it myself. I drove it yesterday coming up from Hot Springs, and I did not find it very enjoyable even then.

Mr. HAMMERSCHMIDT. Will my friend from West Virginia yield?

Mr. RAHALL. I would be glad to yield.

Mr. HAMMERSCHMIDT. Well, to make things relevant, H. L. mentioned that you could have built that road for about $200 million, and I would just remind my colleagues—so we will know where we are now—we have a very important unfinished gap of 71 from I-40 at Alma to Fayetteville, and the cost of what is left to be finished is about 165 million dollars for just that one segment, to put things in perspective.

Mr. MINETA. Mr. Shuster.

Mr. SHUSTER. I want to thank the panel for their very outstanding presentation.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Cramer.

Mr. CRAMER. I want to thank the panel. I have no questions, Mr. Chairman.

Mr. MINETA. Mr. Hancock.

Mr. HANCOCK. Just briefly, I would like to compliment Mr. Hembree for correctly pronouncing the name—the pronunciation of "Missouri." Everybody in Washington calls it "Missouri," but we know better down here, don't we? [Laughter.]

Mr. MINETA. Mr. Nichols.

Mr. NICHOLS. Thank you. I compliment you for the excellent presentation.

Mr. MINETA. Ms. Molinari.

Ms. MOLINARI. Just one quick question, Mr. Chairman, and I want to thank our panel for very exciting testimony. Would it be your suggestion with regard to these toll roads that the tolls be dissolved once the road is paid for?

Mr. WARMACK. I would hope so, yes.

Ms. MOLINARI. Do you all advocate toll structures to pay for the road that would be dissolved?

Mr. PENDERGRAFT. I happen to be a great believer in toll roads. I lived in Oklahoma at the time the toll road system was—the start of the toll road system there. We have seen the tremendous success of that program there. They originally built the Turner Turnpike between Tulsa and Oklahoma City that Mr. Warmack has mentioned—highly successful. They used that as a leverage to build the rest of the system.

Currently, there are four turnpike projects underway in Oklahoma, one of which will connect Tulsa with Siloam Springs, which points out the need for the extension of Highway 412. I think the people of this country will pay a reasonable toll to ride on a four-lane controlled access road as opposed to what we are driving on on Highway 71.

Ms. MOLINARI. Thank you.

Mr. HAMMERSCHMIDT. Will my colleague yield?

Ms. MOLINARI. Yes.

Mr. HAMMERSCHMIDT. Let me just comment about Oklahoma's toll roads. I am not very knowledgeable about those, except it appears to me that after the building of the Will Rogers Turnpike—that first one—they were going to cease and quit collecting the money. I think Oklahoma has experienced the fact that their toll roads have become cash cows. The real producers have become sources of revenue for their entire system, and therefore, they are allowed—now they are building toll roads that may not be as lucrative, but it is a major part of their whole network over there. Thank you.

Ms. MOLINARI. I agree, and thank you, Mr. Chairman.

Mr. MINETA. Mr. Zeliff.

Mr. ZELIFF. No questions, sir.

Mr. MINETA. Very well. Thank you very, very much. I appreciate it.

We are privileged to have the Chairman and the members of the State Highway Commission, as well as the Director, with us today. And I would like to call forward now Ronald E. Harrod, Chairman, Arkansas State Highway Commission; Mr. Bobby Hopper, member of the Arkansas State Highway Commission; Mr. Rodney Slater,

Vice Chairman, Arkansas State Highway Commission; Mr. L. W. "Bill" Clark, member, Arkansas State Highway Commission; Herby Branscum, Jr., member of Arkansas State Highway Commission; as well as Mr. Maurice Smith, Director of Highways and Transportation, Arkansas State Highway Commission.

We are pleased to have all of you with us. Your statements will be made a part of the record. And Mr. Chairman—Chairman Harrod, if you would go ahead and make your oral presentation.

**TESTIMONY OF RONALD E. HARROD, CHAIRMAN, ARKANSAS STATE HIGHWAY COMMISSION; MAURICE SMITH, DIRECTOR OF HIGHWAYS AND TRANSPORTATION, ARKANSAS STATE HIGHWAY COMMISSION, AND BOBBY HOPPER, MEMBER, ARKANSAS STATE HIGHWAY COMMISSION**

Mr. HARROD. Thank you, Mr. Chairman and members of the Committee. We appreciate this opportunity——

Mr. MINETA. Mr. Harrod, could you pull up your mike maybe a little closer to yourself. Thank you, sir.

Mr. HARROD. Is that better?

Mr. MINETA. Yes, sir.

Mr. HARROD. Mr. Chairman and members of the committee, we appreciate this opportunity to present our concerns and discuss issues with you as they relate to the reauthorization of the Federal Transportation Assistance Program. There will be three of us presenting these issues as they affect the Arkansas Highway and Transportation Department. I am Ron Harrod, Chairman of the Arkansas Highway Commission. Following my presentation will be Maurice Smith, Director of the Arkansas Highway and Transportation Department and Bobby Hopper, a commissioner from Springdale, Arkansas. We will be brief, but very specific about the transportation needs in Arkansas and how the issues involved with the reauthorization of the Federal Transportation Assistance Program will affect us.

Our general needs study has resulted in the following conclusions:

A recent in-depth needs study shows our system is wearing out at an alarming rate. Also, we are having difficulty making improvements on our major travel corridors so that Arkansas can compete for industrial expansion and economic development.

In order to keep with these—excuse me—in order to help with these problems, the Arkansas legislature recently approved a 2.5 billion dollars, 15-year improvement program. This program is critically dependent upon substantial amounts of federal assistance. It is not a cure-all. It will provide only for our most critical and pressing problems. Arkansas has an extremely large highway system, the 16th largest in the nation. Forty-six percent is in poor condition and 34 percent is in fair condition and needs improvement to prevent further deterioration.

We were one of the first states to complete our interstate system. And as a result, it is now deteriorating at a rapid rate. A new financially responsive Federal Surface Transportation Program is essential to deal with these needs. Our roadway and bridge status is this—over 90 percent of our system is only two-lane, many of

which are more narrow than current standards permit. Traffic volume and safety problems are escalating, and more importantly, the number of heavy trucks is increasing. Twenty-five percent of the bridges on the state highway system are inadequate. Many are incapable of carrying the 80,000 pound maximum load limit.

Also, there is a compelling need to expand our four-lane system to allow existing industries to expand and new industries to locate in our rural areas. An expanded four-lane system will also accommodate our growing tourism industry. Our needs study indicate that over seven billion dollars is needed over the next ten years. The new legislative program will provide 2.5 billion dollars. We are heavily dependent upon increased federal funding to help supplement our efforts.

There is another important aspect that must be addressed in the new bill. The—there is—the new Federal Transportation Act—there is something I would like to mention. There needs to be a provision in the next transportation act that provides funds for highways to help revitalize the economy of the lower Mississippi River Delta region. Following the recommendations of the congressionally appointed lower Mississippi River Delta Development Commission, action is already underway.

Progress is being made on the Great River Road. A seven-state consortium is meeting this Friday to pursue the study's recommendations. Delta states are contributing their own resources to help provide transportation improvements. Arkansas' new program targets a significant portion of the new revenue for the Delta. We need your help to assist this effort by providing a source of federal funding similar to the Appalachia Regional Commission.

In closing, thank you, Mr. Chairman. I would now like to ask our Director, Mr. Maurice Smith, to discuss with you some specific issues that must be dealt with in the new Federal Transportation Act.

Mr. MINETA. Thank you, Mr. Chairman.

Mr. Smith.

Mr. SMITH. Thank you, Mr. Chairman, members of the Committee. There are several issues now being discussed in Congress, AASHTO, the U. S. Department of Transportation and many other organizations that will have a serious effect and impact on our ability to provide an adequate transportation system for our state. I would appreciate your serious consideration for what I will be presenting as you develop this new Transportation Act.

First is a matter of matching ratios. There are a number of provisions in the proposed legislation that seriously concern us. We agree that the federal government should concentrate its efforts on a national highway system and should provide flexibility and less rigid requirements. We do not agree, however, that the federal government should force the states to increase their investment through increasing their match on various projects. We support a 90 percent share on the national highway system of roads and bridges, and at least 75 percent share on the proposed urban/rural program for bridges, and this system is eligible for 80 percent federal funds. In order to improve and encourage safety, we think the federal share should remain at 90 percent.

We support AASHTO's proposal that divides the money on a 50/50 split between the national highway system and the urban/rural program and a 20 percent transfer position. This is much more responsive to Arkansas' needs than the Administration's proposed legislation, which recommends 67 percent for the national system and 33 for the urban and rural projects. The AASHTO proposal also contains an 85 percent minimum allocation provision for the national system and 100 percent return on the flexible portion of the program. This would provide Arkansas with about 95 percent return on its contributions. Anything less will continue the same inequitable, unacceptable distribution we are now enduring.

Based on 1990 statistics, we receive only 72 cents of each dollar our motorists contribute to the highway trust fund. We are a poor state. Also because of our heavy motor fuel consumption, we contribute more to the highway trust fund than many other states. We are currently subsidizing other states' highway and transit improvements, while our unfunded needs continue to grow. Under the Administration's proposed legislation, we would still be a donor state, but to a lesser degree.

To ensure that past inequities do not occur or re-occur, we would like to see the next Surface Transportation Act include a 95 percent minimum allocation provision for all states. Our situation with the mass transit account is a major disgrace and it is getting worse. With the latest increase in motor fuel taxes, Arkansas motorists are paying 26 million dollars into this fund and get less than a million dollars back. This is less than three percent of every dollar that we send there. UMTA is simply too dominated by the big city transit systems. While people in the major metropolitan areas are enjoying the luxury of sophisticated subways, sleek bus systems, transportation dependent people are suffering economic deprivation for a lack of adequate mobility. The entire allocation process must deal more fairly with the needs of our rural states.

The solutions are to reduce discretionary grants and distribute mass transit account proceeds through the allocation formulas that provides for rural needs. If this is not possible, then provide a 75 percent minimum allocation provision so that rural states can deal with their mobility problems. The AASHTO proposal that would be acceptable to Arkansas, it provides more money to rural states through fair allocation formulas. It provides increased funding. It provides greater flexibility in the use of these funds. The Administration proposal for the revision of the UMTA program is unacceptable. It still overwhelmingly favors the big cities. It does not provide significantly increased funding for rural public transportation needs.

The first goal of our new Federal Transportation Program must be to preserve our existing system. AASHTO and FHWA studies document conclusively that the major contributor to highway deterioration is extensive use of the highways by heavy trucks. Obviously, states with heavy truck concentration will have higher rehabilitation costs than those with lighter concentrations. Therefore, there must be a factor in the allocation formula that reflects the impact of heavy trucks within the various states.

While it may not be perfect, we think that diesel fuel consumption within the various states is currently the most adequate indi-

cator of heavy truck usage. We think the allocation formula in the Administration's proposed legislation is a step in the right direction since 70 percent of the allocation is based on the usage of motor fuel. In order for this formula to be more responsible and equitable, we recommend that motor fuel portion of the formula be further refined to provide 35 percent based on gasoline consumption and 35 percent on diesel fuel consumption. Not only would this account for the heavy trucks, but would provide a strong incentive to crack down on evasion, which should further increase our revenues.

Because of the large concentration of trucks in our state—— highways and bridges—we would greatly be impacted by any changes in the increase in lengths or weights of these trucks. We strongly recommend no changes be made to increase either the truck weight or the length limits.

Thank you, gentlemen and lady, for your attention to these issues. Now, I would like to present to you Commissioner Bobby Hopper, who will discuss an issue that is very critical to us.

Mr. MINETA. Mr. Hopper.

Mr. HOPPER. Mr. Chairman and members of the committee, my name is Bobby Hopper. I live and work in northwest Arkansas. This is the fastest growing area in Arkansas, as well as the region. We are the home of Wal-Mart, Tyson, Whirlpool, Rheem, Ballard Electric and numerous other industries, as well as major truck lines. All of these industries are heavily dependent upon major safe and efficient highways.

The issue that is most critical to me and the people I represent is the size of the proposed national highway system. Our area is badly underserved by major highways. It is critical that adequate mileage be provided on the federal aid system so that we can get to I-40 in the south, the Oklahoma system to the west, the Missouri interstate system to the north and I-55 to our east.

The current FHWA proposal would only provide about 2,000 miles for our entire state. This is simply too small to provide for what we need. The states need the flexibility to determine the size of their system. The old way that provides four percent of the rural system and ten percent of the urban system is still the best. It would provide about 3,500 miles in Arkansas that would qualify for federal aid for major highways. This works well for Arkansas. It would reduce the national system some, but would still cover most of our major traveled corridors. Instead of a maximum of a 150,000-mile system, we recommend a 200,000-mile system to accommodate states' needs and resolve this needless controversial issue.

In addition to adequate mileage on the proposed system, we need adequate funding. It just does not make good sense to have billions of dollars set in the highway trust fund, while industry and tourists are being stifled because of lack of road funds. The trust fund balance must be drawn down now and this money put into the roads where it was intended and committed. Also, the idea of using the highway trust fund and fuel tax increases to make the deficit look better is self-defeating. It hurts our economy, as well as the national economy. We ask you to stop using this method to balance the budget.

Finally, we would like to deal with expensive federal red tape. Both AASHTO and the Administration's legislative proposal have good ideas for this. Wetland policies, rigid standards, relocation requirements and volume regulations all combine to stretch out the time it takes to get a project to contract and increase the costs at an unbelievable rate. It is time to fix this problem now. There are a lot of good ideas for doing this. We think it is crucial to the future Federal Transportation Program to put them into effect.

In closing, on behalf of the Arkansas Highway Commission and Department, I want to thank you for coming to Fort Smith to hear our ideas. Please consider our recommendations, especially for matching ratios, mileage on the national system, funding split between the national program and the urban/rural program and the minimum allocation provision for highways and transit. Thank you for giving us this important opportunity.

Mr. MINETA. Thank you very much, Mr. Hooper, Mr. Chairman, Mr. Smith. First of all, let me ask, did Arkansas submit a map as part of the submission requested by the Federal Highway Administration when the—in the preparation by the Federal Highway Administration for their highways of national significance, or rather, national highway system? Did Arkansas, as part of that request, submit a map as to what they would like to see included as part of the highway system?

Mr. SMITH. Yes.

Mr. MINETA. And roughly, how many miles was that?

Mr. SMITH. About 3,500 miles.

Mr. MINETA. About 3,500 miles. Now, if we are to make this program completely flexible, as the Administration's program has the urban pot, the rural pot and then, it has the bridge pot. If we are to make this completely flexible with the only condition being that they be distributed fairly and equitably between rural and urban areas, how do you envision that the State of Arkansas would split that portion to be fairly and equitably distributed? I am wondering in your view, should the urban and secondary system designations be maintained? Mr. Smith or Chairman Harrod.

Mr. HARROD. I would think they should be maintained, and our allocation between rural and urban have been on equal footing and we have many backlogs and needs in both of those categories currently.

Mr. MINETA. And we should maintain the bridge category as a separate category?

Mr. SMITH. Yes sir, I think so.

Mr. MINETA. And not integrated as one of the eligible programs under the new highway bill. Very well.

Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. Thank you very much, gentlemen, for your appearance and for your fine testimony. Just to pursue Mr. Mineta's question a little further, you know, the Administration's proposal on the mileage for the National Highway System is about 150,000 miles. If it was raised to 200,000 miles, as you have suggested in your testimony, could you support a higher split in funding in rural/urban away from 50/50? Could you go toward that 67/33 percent split, or have you considered that?

Mr. SMITH. How much transferability would we have?

Mr. HAMMERSCHMIDT. Well, we are moving toward giving a considerable amount. We are looking at the flexibility and transferability, but I do not know. But that would depend on the transferability, I guess.

Mr. SMITH. Yes, sir. If we could have a 50/50 split on the transferability and a 50 percent——

Mr. HAMMERSCHMIDT. So, you would want to move more toward transferability if you yielded more toward the split?

Mr. SMITH. Right.

Mr. HAMMERSCHMIDT. I can understand.

On another subject, you support a funding formula for the national highway system divided on the fuel factor of 35 percent on gasoline and 35 percent on diesel fuel. Since the gasoline consumption factor has been criticized as encouraging fuel use by automobile drivers, could you support a fuel factor based on diesel fuel use only?

Mr. SMITH. Well, I have not given it—from my—personally, I have not given that any thought. I assumed that we were going to use both.

Mr. HAMMERSCHMIDT. It might be helpful to us if you would supply us a response for the record so we get your views on that because that is something that we are looking at in the allocation formulas.

Mr. SMITH. We would be glad to, sir.

Mr. HAMMERSCHMIDT. I might say, I think all of you gentlemen know that you are preaching to the choir on getting the money out of the trust fund. We have tried every way in the world to do that. You know, we have been spending about 12 billion dollars a year out of the trust fund for the last several years. Now, with the new 2.5 cents a gallon tax going into the trust fund and 2.5 cents going toward the deficit reduction for at least two more years, we are now going to spend 85 billion dollars over the next five years—about 17 billion dollars a year, which of course, will be an increase proportionately, according to how we write the bill and how the allocation formula works. So, we are moving in the right direction, but of course, we want to get that figure on up to about 20 billion if we can, and the only way we can do that is to get money out of the highway trust fund—use the money for what it was paid in for in the first place. So, we totally support your views on that.

I will not take time to ask any more questions, but because of your official position and your very great knowledge, we might submit questions to you for the record so we can get it into our record, if we may.

Mr. SMITH. We would be happy to. Thank you, sir.

Mr. HAMMERSCHMIDT. Thank you very much.

[The following was received from Mr. Smith:]

ARKANSAS STATE HIGHWAY AND TRANSPORTATION DEPARTMENT,
*Little Rock, AR, May 15, 1991.*

Hon. JOHN PAUL HAMMERSCHMIDT,
*Member of Congress,*
*Washington, DC.*

Dear Congressman Hammerschmidt: During the field hearing on Surface Transportation Programs held last month in Fort Smith, you asked for our views on the use of diesel fuel as a factor in future apportionment formulas.

You may recall that 70% of the administration's proposed allocation formula would be based upon the state's motor fuel sales. It was our suggestion that this 70% be further broken down so that 35% would be based on gasoline sales and 35% on diesel sales to reflect the impact of heavy trucks.

During the hearing, you asked me if I thought the entire 70% portion should be based on diesel sales. While this would work very well for Arkansas, since we have a disproportionate share of heavy trucks impacting our pavements and bridges, it would not be responsive to states with high traffic volumes that depend on apportionment formulas to provide funding for additional lane capacity. Because of this, we thought the 35%-35% breakdown would more equitably accommodate both needs.

We appreciate your interest in seeking elaboration on this point because we think it is a major issue that should be dealt with equitably in the new Transportation Act. We would welcome the opportunity to work closely with you and your staff on additional issues as they develop.

Sincerely,

MAURICE SMITH,
*Director of Highways and Transportation.*

Mr. MINETA. Mr. Shuster.

Mr. SHUSTER. Thank you very much for your excellent testimony.

Mr. MINETA. Any other members of the panel who wish to ask questions of our distinguished panel? If not, again, thank you very, very much. I appreciate it.

I would now like to call on Mr. Joe Powers, Chairman, Fort Smith Chamber of Commerce; Mr. Robert E. (Swede) Lee, President, Texarkana Chamber of Commerce; James Regnier, Past-President, Waldron Chamber of Commerce; Jerry Montgomery, Major of the City of Mena and L. P. Renard, Chairman, Industrial Development Committee, Nashville Chamber of Commerce, Nashville, Arkansas.

We are pleased to have all of you here before us today. And Mr. Powers, we want to thank you very, very much for your hospitality. I hope you are feeling a little better from—you missed last night's great party, but we appreciate very much the hosting of these events and the hospitality that has been shown to us by members of your Chamber. So, all of your statements will be made a part of the record, and if you would go ahead and proceed in your own fashion.

**TESTIMONY OF JOE POWERS, CHAIRMAN, FORT SMITH CHAMBER OF COMMERCE; ROBERT E. [SWEDE] LEE, PRESIDENT, TEXARKANA CHAMBER OF COMMERCE; JAMES REGNIER, PAST-PRESIDENT, WALDRON CHAMBER OF COMMERCE; JERRY MONTGOMERY, MAYOR, CITY OF MENA AND L.P. RENARD, CHAIRMAN, INDUSTRIAL DEVELOPMENT COMMITTEE, NASHVILLE CHAMBER OF COMMERCE**

Mr. POWERS. Chairman Mineta, Congressman Hammerschmidt and members of the Surface Transportation Committee, I am Joe Powers, Chairman of the Board of the Fort Smith Chamber of Commerce. We sincerely appreciate you coming to Fort Smith to hold this important public hearing and want you to know that we consider it a distinct honor for the citizens in our area.

Our Number one priority for discussion here today has to be the upgrading of Highway 71 from Kansas City, Missouri to Shreveport, Louisiana. This north-south corridor is absolutely essential for the economic growth and development of mid-America. This is not just an isolated and localized need. It is the connecting link from

Canada to the Gulf of Mexico that allows mid-America to compete in the international market. There are eleven states in this central part of the United States which account for more than 45 million people. We are grateful for the progress being made on Highway 71 to the north, but there is an absolute void when it comes to connecting Fort Smith with Texarkana, which would complete the missing link in this north-south corridor.

We have over 200 manufacturers in this local area, but their just-in-time production schedules puts tremendous pressure on the motor freight carriers to provide fast, reliable service. Again, local carriers are handicapped in their efforts to deliver goods in Missouri, Texas and Louisiana in a timely manner. Local manufacturers are also hampered when their production schedules depend on the timely receipt of raw materials from those markets. This is a distinct drawback when it comes to recruiting industrial prospects. We are right in the middle of a tremendous gap in the existing north-south interstate system.

We need this four-lane through here not only for economic growth and development, but also in the interest of national defense. There are 12 to 15 military installations located in our surrounding states, and our narrow two-lane, winding roads are hardly safe for hauling weapons systems and support equipment between them. We believe that this particular segment of highway is a critical part of the national highway system and should be given a higher priority in the interest of the nation's welfare and defense.

I would like to shift to some comments regarding the Surface Transportation Assistance Act of 1991. Now, please keep in mind that I am in the banking business and I am not a transportation specialist. But however, I would like to urge you to consider the following:

Number one, to maintain the federal aid urban system and other categorical funding programs rather than combine many of them in a new urban/rural program.

Number two, maintain the current funding match ratios, rather than reduce the federal share, while increasing the state local share.

Number three, if the urban/rural program is implemented, develop a mechanism to ensure that the various states do not establish a competitive environment, not only between the urban and rural areas, but also among the urbanized areas within the state.

Number four, strong support should be given to the retention of the interstate program as is proposed by the Act. This program would present the best method of funding and building the southern extension of U.S. Highway 71 as a four-lane controlled access facility. If it is not identified as an interstate highway, it would go into the larger group of projects under the urban/rural program which could become a competitive program and weaken the timely completion of the U.S. 71 project.

Number five, if the act is passed as is proposed, there is a section of the act that enables the designation and funding of scenic highways. The significance of this section is that the existing U.S. 71 could become eligible for such a designation once the new highway between Fayetteville and Van Buren/Fort Smith is completed.

Such a designation would help mitigate the economic losses that are likely to occur along the old highway due to the decrease in traffic and usage. This designation and the subsequent improvements to the highway would create a parkway environment similar to the Blue Ridge Parkway and serve as a catalyst for the continued economic activity, as well as new development that would support the increasing tourism industry.

And Number six, under the proposed act, there are several funds for innovative research projects. These funds would be available for both planning and construction. Hopefully, Fort Smith could pursue these funds in an attempt to resolve the growing traffic problems on our main thoroughfare, Rogers Avenue. Fort Smith has submitted the Phoenix Avenue extension project as a partial solution to this existing problem. Your support here would be greatly appreciated.

In summary, the need for an upgraded U.S. Highway 71 has been clearly documented for several years. In the interest of public highway safety, the injuries and fatalities are totally unacceptable with individual motorists and motor freight carriers using tandem tractor-trailer rigs, driving these narrow, winding, two-lane roads to haul everything from chickens to hazardous material. We meet the criteria to be a part of the highway—national highway system. And hopefully, we are convincing you that there is an urgent need to complete this last gap in the north-south corridor without further delay.

The old-timers down here used to tell us the way to solve a problem, you must first pick up a pencil or take the first step. Well, ladies and gentlemen, we have reached that point where we simply must take the first step and make that four-lane highway a reality, and we need to do it now.

Once again, I do want to thank you for conducting your meeting here in Fort Smith. I appreciate all of the nice compliments, Mr. Chairman, about our Chamber. We are excited about having you here. And thank you for allowing me to have the opportunity to speak with you.

Mr. MINETA. Thank you very much.

Mr. Lee.

Mr. LEE. Thank you, Mr. Chairman. My name is Robert E. Lee. I am the President of the Texarkana Chamber of Commerce. The Texarkana Chamber is somewhat unique in that we serve two cities; Texarkana, Texas and Texarkana, Arkansas. The Texarkana Chamber of Commerce is also the headquarters of the Mid-America Connection Compact, which had its birth in 1986 at a meeting held and sponsored by our Chamber in Texarkana in July of 1989—excuse me. And some representatives from six states attended that meeting with about 150 or 160 people to demonstrate and plan and show support for the Highway 71 upgrade.

Today, MAC-PAC is an organization of over 900 members from ten states in our nation's heartland. They all share at least one common goal, the upgrade of U.S. Highway 71 between Kansas City, Missouri and Shreveport, Louisiana to a four-lane controlled access highway.

On behalf of Texarkana and MAC-PAC, I would like to express my appreciation to Chairman Mineta and all of the members of the Committee for holding this field hearing.

First, I would like to call the Committee's attention to the Kansas City, Missouri to Shreveport, Louisiana multi-state freeway corridor study. This study was prepared in response to the Federal Aid Highway Act of 1987. It was completed in December 1987 and approved by the U.S. Department of Transportation in April 1988. The written testimony I have submitted includes six major functions the proposed freeway would provide. However, to save time, I will address only two here.

First, the proposed freeway would connect I-29 and I-35 in Kansas City with U.S. Highway 59 at Texarkana and I-49 in Shreveport, which would then provide the best possible route from the Canadian border and the Great Lakes to the ports of Houston and New Orleans. Secondly, it would enhance our national defense by replacing some 250 miles of U.S. Highway 71, which is now two-lane, in the states of Missouri, Louisiana and Arkansas, which currently serve 13 major military installations.

Secondly, I would like to call attention to the Surface Transportation Act of 1991. This act calls for the establishment of a national highway system, as you have discussed at length today. Section 102(a) of this act describes the national highway system to provide an interconnected system of principal arterial routes which will serve major population centers, ports, airports and international border crossings; meet national defense requirements and serve interstate and interregional travel.

The Kansas City to Shreveport corridor study clearly demonstrates that U.S. Highway 71 meets every requirement for inclusion in the national highway system. The U.S. Department of Transportation, by approval of the feasibility study, documents that this highway in its present condition cannot fill its appropriate role in the national highway system.

Finally, like others on the panel today, I would like to call attention to safety. Just this last Friday, April the 20th, I received the latest accident data from the Arkansas Highway Department. In 1989, in Arkansas alone, there were 3,010 accidents, 1,602 injuries and 34 deaths on Highway 71 within the State of Arkansas. This is up substantially from the 800 injuries and 2,039 accidents reported in the 1987 feasibility study.

We request that this committee carefully review the funding formula for construction of national highway system highways proposed in the Surface Transportation Act of 1991. This act provides only one, as I understand it, federal/state ratio of funding. Under such a plan, individual states are almost certain to use available funds to address politically expedient intrastate projects before those truly needed and truly of national significance.

Certain segments of the national highway system are just as critical to the nation's defense and general welfare as the interstate highway system was when it was designed. We believe the Surface Transportation Act of 1991 should provide funding for qualified multi-state segments of the national highway system at the same level as interstate highways. This will prevent a single State from

delaying construction of a highway with multi-state and national benefits.

The case for upgrading U.S. Highway 71 to at least a four-lane divided highway with full access control in urban areas is clearly documented. The DOT approved feasibility study, coupled with the criteria for inclusion in the national highway system, makes it evident that upgrading Highway 71 cannot be allowed to wait any longer.

There are 45 million people who reside in the eleven states that this corridor would serve from the Canadian border to the Gulf. There are, in fact, 20 million Americans who live within 50 miles of either side of the highways that make up this corridor. For all of them, I thank you, members of the Committee, for holding this hearing today.

Mr. MINETA. Thank you very much, Mr. Lee.

Mr. Regnier.

Mr. REGNIER. Thank you. I am Jim Regnier, and I am from Waldron, Arkansas, which is about 45 miles south of Fort Smith here.

A four-lane highway down the corridor of western Arkansas is what we need. There can be little argument that our interstate systems have reduced the number of accidents and made travel much more efficient, as well as safer. But for those areas which do not have immediate access to a four-lane highway, the prospects for economic growth are much gloomier. We in Waldron, Arkansas can testify to that statement, as we have seen several prospects choose development sites along I-40 during the past several years, rather than on Highway 71.

Why do the people of our area, Scott County, need economic growth?

Scott County has been ranked in the lowest 20 percent for per capita income in the U.S. for 1950, 1959, 1969 and 1979. Poverty is persistent and the first requirement is jobs for our people. The opening of western Arkansas would give us the opportunity to attract those jobs.

Scott County has a total population of approximately 10,500 people, and the only community of any size has a population of roughly 3,000 of that total. Rural communities are often heavily dependent on a single industry for economic viability. In order to protect the area from swings in business cycles, we must attract a diversity of industry. But any industry must have a means of moving its product to market. A four-lane system will provide such a means.

The residents of Scott County are particularly dependent on roads. Arkansas ranks 15th nationally, with 911 of every 1,000 licensed to drive. The four-lane would open up our county and make travel much safer and more efficient to those numbers who must seek jobs elsewhere, such as in Fort Smith.

Waldron and Scott County enjoy an excellent modern healthcare system. However, when specialists or special services are demanded, the result is a 45-mile trip over what must be one of the poorest stretches of U.S. highway in the nation.

Scott County and Waldron have always taken great pride in their public schools. However, we see many of our graduates leaving to find jobs, and particularly, many of our brightest young

people have no choice but to leave. We must create jobs which will provide an opportunity for those young people to remain and help continue to build.

Even with the lack of industry and jobs, we do see the Waldron area continue to grow. We are surrounded by Ouachita Mountains with several large mountain ridges traversing the county, and we are certainly one of the most beautiful areas in the nation. In a state which counts tourism as a major economic force, this four-lane system would traverse one of the most scenic vistas in the state and make it accessible to tourism more than ever.

Western Arkansas has the ingredients for the explosion of growth that northwestern Arkansas has been experiencing. We have an attractive tax base, a pleasant climate, an available work force with a strong work ethic, a scenic countryside and ample power and water to support growth. A four-lane system will provide the access to this area which is just beginning to witness the influx of people.

Major industries in Scott County include one of the largest Tyson production plants, Sampling Technology, Inc., which is a leader in world production of air monitoring equipment, and we also have other large agriculture and timber industries. Other smaller industries share with these a need for access today, a need which will continue to grow.

Along with our citizens, I strongly commend Representative Hammerschmidt for his foresight in seeing the urgent need for this project and for his efforts to provide for this development. Thank you.

Mr. MINETA. Thank you very much.

Mr. Montgomery, the Mayor of the City of Mena.

Mr. MONTGOMERY. Thank you. Mr. Chairman and members of the Committee, I am Jerry Montgomery, Mayor of the City of Mena, Arkansas. Mena is located in west central Arkansas and has a population of 5,500, with an estimated trade area of 25,000. On behalf of myself, the city council and all the citizens of Mena, I sincerely express our gratitude for the opportunity to appear before this distinguished committee.

In our search for industries to locate in our area, we have found that most companies prefer to locate in an area no more than 30 miles from an interstate or four-lane highway system. The nearest interstate highway to Mena is approximately 80 miles away. Studies by the Missouri Department of Economic Development show that transportation is the third most important factor to companies considering a location. Studies by the Arkansas State Highway and Transportation Department revealed that the second highest commodity desire flow patterns through the state occur from the Kansas City area southward toward the Gulf of Mexico. Kansas City is one of the largest interior foreign trade zones in the country and a major benefit of an improved four-lane divided highway with limited access control would be to increase the exporting products produced in western Missouri and the central States to the Gulf of Mexico port of New Orleans.

The western side of Arkansas was excluded in the development of a four-lane interstate program, and this has had an adverse effect on our economic growth because of an inadequate transporta-

tion system through our region of the state. Four of the state's largest employers, Emerson Electric, Wal-Mart, J. B. Hunt Transport and Tyson Foods, are very heavy users of U.S. Highway 71.

In our area of the State, tourism, which affects our local economy by creating thousands of jobs, is highly dependent upon quality highways. It is a known fact that many tourists and vacationers bypass our beautiful region simply because the highway system is inadequate and dangerous. The magnet to entice tourists to the numerous lakes and rivers is an improved U.S. Highway 71, which would assist in the full development of both natural and human resources. The existing Highway 71 in western Arkansas is a two-lane highway, serving a high traffic volume and insufficient passing sight distances. Motorists must contend with steep inclines and segments of highway that have a narrow surface with a ten feet per lane and no shoulders. Motorists' safety is a major issue on this existing north-south route. Sections of the existing two-lane Highway 71 has a current annual average of six accidents per mile, resulting in 3.2 injuries per mile and one death every 4.7 miles.

Considering lead and construction time and budgetary constraints faced by Congress, I feel a practical approach would be to upgrade Highway 71 to a four-lane divided highway with limited access control. This approach would avoid much of the expense of planning new routes, acquiring expensive right-of-way and minimize environmental impact studies and effects. An entirely new interstate system would not likely be completed within my lifetime, whereas an improved Highway 71 would give Mena and Polk County much needed relief in a shorter period of time.

In closing, I want to thank Congressman Hammerschmidt for the opportunity to appear before you and give you this message from our people. Western Arkansas is such a beautiful part of our country, and I sincerely hope you enjoy your visit.

Mr. MINETA. Thank you very much, Mr. Mayor.

Mr. Renard.

Mr. RENARD. Chairman Mineta, Subcommittee members, thank you for being here today and thank you for giving me a chance to give testimony to this Subcommittee. I am L. P. (Larry) Renard, Chairman of the Industrial Development Committee of Nashville, Arkansas Chamber of Commerce. I am also Chairman of the Industrial Association of Nashville. Nashville is located approximately 50 miles north-northeast of Texarkana and about 20 miles east of Highway 71 in the southwest part of Arkansas.

I am employed full-time as President and General Manager of Briar Gypsum, and that is the job that pays my salary and pays my expenses to travel here today. I am a native of Kansas, born and raised in Concordia. I have been in southwest Arkansas since 1951. I do considerable traveling in my business and I do considerable business in some of your states.

Just recently, I have been in Huntsville, Alabama; I have been in Kansas City; I have been in St. Louis; I have been in Washington, D.C., Virginia, New York, New Hampshire, where we do business, and I travel many of those roads and those States and ship into those States.

The people I am representing in Nashville, Howard County, Arkansas and southwest Arkansas support the construction of Inter-

state Highway 49 and/or Highway 71 Corridor. We even go so far as to say we support increased taxes for the construction and improvement of the highway system.

Southwest Arkansas has decent interstate high connections to the southwest and the northeast portions of the United States using Interstate 30. We have fair interstate connections to the east and southeast parts of the United States going to Shreveport and using Interstate 20. But our connections to the south are poor and to the north, very poor. This 71 Corridor and the feeder roads that will run into it will provide us a much safer highway system to the north and to the south.

Nashville and Howard County, the area I represent, has experienced considerable industrial growth in the last several years. Nashville is a town of approximately 4,500 people, and we have over 3,000 employees working in our industrial facilities. Our traffic is bumper to bumper in the morning and in the evenings. The industrial plants have been asked to stagger their starting and quitting times to help the traffic situation.

Our inbound, as well as our outbound truck traffic, is heavy. The business I represent ships an average of 40 semi-trailer truckloads of material every day. Potential customers in the northwest part of Arkansas tell us it is easier, cheaper and better for them to bring their material in from western Oklahoma, which is over 100 miles further away, rather than to buy from us and haul north on U.S. Highway 71.

There have been several studies and committee hearings regarding improving highways, and the people I represent have given testimony supporting improved highways each time. The three studies I am familiar with are "Transportation 2020," which was a federal committee that held hearings and was supposed to develop a consensus on a national transportation plan to meet America's needs in the 21st Century. The second was the Arkansas State Highway Department's "Economic Development Corridor Improvement" concept. This concept proposed connecting all cities in Arkansas with a population of 10,000 or more with a four-lane highway and connecting all cities with a population of 5,000 or more with a four-lane highway within 20 years. The third was an outgrowth of the second and was "An Economic Impact Study Intrastate Corridor System 1990 to 2010." All of these studies recommended Interstate 49 and/or the Highway 71 Corridor, and we in the Nashville area support those conclusions.

If you have not, I highly recommend to you as a member of this Committee, that you obtain a copy and read the "Economic Impact Study Intrastate Corridor System 1990–2010" by the Southwest Arkansas Planning and Development District. This study does an excellent job reviewing the economic impact of the Highway 71 Corridor.

Our aim and goal in Arkansas and Howard County is to raise the standard of living of our community, and we just happen to believe this can best be accomplished by industrial development, while maintaining our rural atmosphere and protecting the environment.

Thank you for being here today and thank you for giving me the opportunity to give this testimony.

Mr. MINETA. Thank you very much, Mr. Renard. Is that an extra copy of that economic impact study?

Mr. RENARD. It is my personal copy, but I would be glad to give it to you and I can get another copy and get copies for any member of the Committee that would like to have one.

Mr. MINETA. That would be fine.

[The study referred to, "An Economic Impact Study, 1990/2010, Interstate Corridor System, Southwest Arkansas Planning & Development District, Inc." was received for the record and appears beginning on 2423.]

On this whole issue involving the 71 Corridor, the north-south corridor, is there any data regarding the highway percentage of truck traffic as opposed to automobile traffic, and if the highway were expanded, would you expect those ratios to continue or would you expect one mode to increase over the other? Would anyone like to venture an opinion on that issue? Swede?

Mr. LEE. I think that data is included in the feasibility study that was prepared for Congress. My memory says that the truck traffic would comprise about 25 percent, but I know the data is in a part—is a part of the feasibility study.

Mr. MINETA. And are the other communities in, let us say, Missouri, Oklahoma, Texas as committed to the development of this north-south corridor as all of you here in Arkansas seem to be committed to it? Swede, maybe from your perspective—for the Mid-America Compact you were talking about, have you found that kind of enthusiasm for this, Mr. Lee.

Mr. LEE. The enthusiasm along the eastern corridor of Oklahoma is certainly in strong support of this project. And we have had—we have on record all the way from Houston, Humboldt, Gulf Coast area up Highway 59, which is being upgraded to a four-lane controlled access facility and is almost completed from Texarkana to Houston. And the Texas Highway Department projects that if we get the link from Texarkana north to Kansas City, the traffic on Highway 59 will almost triple as the result of this being a much more cost-effective and time-effective route from all of the Gulf Coast, as well as the Gulf Coast in Louisiana, of course, to the north central part of the country and the northeast.

So yes, there is a strong support for this project that I am fully aware of in Texas, Louisiana, Arkansas, Oklahoma, Missouri, and I think we have had some indicators of good support from Kansas, although I really have not worked that area very hard.

Mr. MINETA. I was shocked by—well, I should not say "shocked"—I was impressed by a member of your Chamber of Commerce who is a trucker who said that he stays on the Oklahoma side, rather than coming in on the 71 side of western Arkansas because of the nature of the road system and the safety record. He says that his record is good on the Oklahoma side, but he is afraid to take that kind of a chance on the western Arkansas side.

Mr. POWERS. A lot of the people that go to Mena from Fort Smith go through Oklahoma, rather than 71.

Mr. MINETA. Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. Thank you very much, Mr. Chairman.

Gentlemen, I wanted to make sure that we had a diversified panel that represented what is going on on the southern end of 71

between Texarkana and Fort Smith, and we have it here today from the Chamber, from the private sector, from the government sector—all of you who know it so well. And this Economic Impact Study of the Interstate Corridor from 1990 to 2010 that Mr. Renard called to our attention, I am familiar with it. So, I do not think there are any questions we could ask that are not covered in that study, and I am glad the Chairman wants to make it part of the record.

There is another study, as you all know, that was very important. We got about $260,000 to do a study—a four-state study that Arkansas Highway Department was the lead commission on that study. And that study was completed, and as you know, the benefit/cost ratio was very favorable and it recommended that Highway 71, the north-south corridor, be upgraded. And of course, we have that as part of our record as well.

But we very much appreciate your statements. I have no questions.

Mr. MINETA. Mr. Shuster.

Mr. SHUSTER. Thank you, Mr. Chairman. Mr. Montgomery, you mentioned that sections of the existing two-lane Highway 71 has a current annual average of six accidents per mile, resulting in 3.2 injuries per mile and one death every 4.7 miles. How many miles are you including in that section? What distance does that represent?

Mr. MONTGOMERY. Basically, the section of Highway 71 through Arkansas—I do not have the exact figure on the mileage, but through the Arkansas section.

Mr. SHUSTER. In other words, from Missouri south to Louisiana.

Mr. MONTGOMERY. Yes, sir.

Mr. SHUSTER. Thank you very much.

Mr. MINETA. Mr. Rahall.

Mr. RAHALL. No questions.

Mr. MINETA. Any other members of the panel who wish to ask questions of this distinguished panel?

[No response.]

Mr. MINETA. Thank you again very much for participating. Mr. Lee, we appreciate very much your bringing up your whole delegation from Texarkana. Mr. Powers, again, thank you very much for your hospitality.

At this time, I would like to call on Mr. John Lewis, President of the Bank of Fayetteville. We are pleased to have you here this morning with us. Your statement will be made a part of the record. You may proceed.

## TESTIMONY OF JOHN LEWIS, PRESIDENT, BANK OF FAYETTEVILLE AR

Mr. LEWIS. Mr. Chairman, members of the committee, John Paul, thank you for coming to Arkansas. Since my written statement is part of the record, I am going to depart from that somewhat.

I concur in the objectives of the new national legislation, and I feel like the objectives will be fulfilled with further investments in Arkansas. Number one, it will help international competitiveness.

Number two, it will help state and local economic development. Number three, it will improve the quality of life. Number four, it will improve public safety. And we, too, concur in finding a consistent and stable source of funding.

A new highway infrastructure program must be designed, as Chairman Roe has stated, to invest in the rebuilding of America's infrastructure and to halt the decline in the nation's productivity. Mr. Chairman, it pleases me to tell you and your committee that western and northwestern Arkansas is one of the most productive areas in our nation. In this area reside corporations that are competitive with companies in the entire world.

It was my pleasure to report to your committee in the last hearing held in this area the reasons for this magic. Number one, the genius of our entrepreneurs. Number two, the productivity and the care of our work force. Number three, the intense local competitive environment. And number four, the talent at the University of Arkansas that allows our companies to constantly upgrade.

A continued investment by our government in the needed infrastructure of our area is going to benefit an area that is paying its way in taxes and taxing itself for further developments. Arkansas and its people have shouldered responsibility for their share of that partnership. Arkansas has just enacted a 36 percent increase in its gasoline tax and a 47 percent increase in its diesel fuel tax to fund the state's portion of a $2.5 billion program to improve Arkansas highways. I am pleased to note that the first project that was announced from the new Arkansas highway program calls for the construction of U.S. 412 as a four-lane facility to connect northwest Arkansas to Interstate 44 along Oklahoma's Cherokee Turnpike.

Now if I may, I would like to introduce something personal. Highway 71 and 412 follow closely the routes of settlement of our area. My grandmother's grandfather was a doctor. He immigrated down the Mississippi River, came up the Arkansas River to Fort Smith. He then traveled overland from Fort Smith through the mountains to Fayetteville to what was then known as Lovely County in 1830. The Louis part of my family, starting in 1690, came the 412 route from Virginia to Wilson County, Tennessee, then Missouri, then Arkansas. And in 1895, the two families met and established a partnership. The roads are important to my family. These roads are important to our nation. A hundred and sixty-one years ago, my ancestor made the trip from Fort Smith to Fayetteville through the mountains. This afternoon, I will retrace that trip. My trip will be more dangerous. Thank you. [Laughter.]

Mr. MINETA. Oh, for the good old days. [Laughter.]

Mr. Lewis, thank you very much. You have indicated support for the addition of a limited number of miles of routes to the interstate system. Do you have any idea as to what kind of criteria we ought to be using to qualify those routes that we might select for addition to the interstate system?

Mr. LEWIS. Well, as my opening comment said, I think we should—when we have a productive area that is paying its way in taxes, we should help that area, and that is what we have in northwest and western Arkansas.

Mr. MINETA. Now, you indicated that the first project that the state adopted was this U.S. 412 as a four-lane facility. What factors

do you think were taken into consideration by the State to make the decision that that be one of its top priorities.

Mr. LEWIS. I think it was based on public safety. Oklahoma will have a four-lane road coming from Tulsa to the Arkansas state line——

Mr. MINETA. That is a turnpike. What was the name of that?

Mr. LEWIS. Cherokee Turnpike.

Mr. MINETA. Cherokee Turnpike, that is right.

Mr. LEWIS. It will be completed this year. The travelers coming from Oklahoma into Arkansas would go from a four-lane road into an antiquated two-lane road that is already a very dangerous highway, so I commend our Highway Department for their commitment to build this four-lane road.

Mr. MINETA. Very well, thank you very much.

Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. John, I know the Highway Department has now said they plan to build 412 from Siloam Springs to 71, and they have even indicated where the new route would be—the new corridor. But do you know what their plans are, how soon that would be completed and how they plan to fund it?

Mr. LEWIS. I am not familiar with those details.

Mr. HAMMERSCHMIDT. I was intrigued and a bit chagrined when I noticed that the State Highway Department toll road study by Wilbur Smith and Associates showed that that little corridor there would not support a toll road, except at about a 21 percent level or something like that. And just eyeballing that as a layman with all that traffic, I cannot quite imagine that that study is totally correct.

Mr. LEWIS. I was also amazed by that and feel like——you know, that if we had the road, we would have the traffic because of all the heavy truck traffic from Wal-Mart and Tysons and the other companies in northwest Arkansas. I feel like they would be pulled toward that road. It is a very dangerous stretch of the road right now.

Mr. HAMMERSCHMIDT. I know as Vice Chairman of the Northwest Council, along with Alice Walton, you all have a great interest in all the economic development, particularly along that road. But also, I know you are here to promote 412 all the way east-west across the state of Arkansas.

Mr. LEWIS. Yes, sir.

Mr. HAMMERSCHMIDT. And I think that the most traveled and most lucrative end as far as traffic goes, would be the western end. But still, your ultimate goal is to build that road all across the east-west part of Arkansas.

Mr. LEWIS. It needs to be done.

Mr. HAMMERSCHMIDT. And it would connect in a major east-west connection across there.

So anyway, John, thank you very much for your testimony. I appreciate you being here today.

Mr. MINETA. Mr. Cramer.

Mr. CRAMER. No questions.

Mr. MINETA. Mr. Hancock.

Mr. HANCOCK. No questions.

Mr. MINETA. Mr. Nichols.

Mr. NICHOLS. No questions, Mr. Chairman.

Mr. MINETA. Ms. Molinari.

Ms. MOLINARI. I have no questions.

Mr. MINETA. Mr. Zeliff.

Mr. ZELIFF. No questions.

Mr. MINETA. Well, let me thank you again, Mr. Lewis, for first of all, the—not only the fine testimony here, but your wonderful hospitality when we had our hearings in Springdale. It was just great.

Mr. LEWIS. Thank you, Mr. Chairman.

Mr. MINETA. Nice to see you again. Thank you very much, sir.

I would now like to call on a panel consisting of the Honorable Steve Hettinger, the Mayor of City of Huntsville, Alabama, accompanied by Mr. J. E. (Ed) Mitchell, Jr. of Mitchell and Mitchell, Inc. of Huntsville, Alabama. At this time, I would like to yield to our very fine colleague, Mr. Cramer, from the 9th Congressional district of Alabama.

Mr. CRAMER. Thank you, Mr. Chairman. It is my pleasure to introduce the Mayor of the City of Huntsville, which happens to be my home town there in Alabama. Steve Hettinger is no stranger to our area. He came to Huntsville in 1967 with the nation's space program, which is typical of the way that we pulled people into that area of the country. He has also worked as an urban management consultant.

Maybe more importantly, he was part of the campaign team which successfully elected my predecessor, Congressman Ronnie Flippo. As a consequence of that, he joined the Congressman's staff as his district representative. He returned to private practice and was in engineering management. And in 1988, he was elected Mayor of Huntsville. I present to this panel and this audience the Mayor of the City of Huntsville, Mayor Hettinger.

Mr. MINETA. Mayor, it is great to have you here. If you would go ahead and introduce also your fine colleagues who have accompanied you, we would appreciate that very much.

## TESTIMONY OF HON. STEVE HETTINGER, MAYOR, CITY OF HUNTSVILLE, AL; PERRY HAND, DIRECTOR OF THE ALABAMA HIGHWAY DEPARTMENT

Mr. HETTINGER. Mr. Chairman I would like to introduce a large delegation at the end of my statement. I think, that perhaps there may be some questions of them also. But I particularly would like to introduce on my left the Director of our Alabama Highway Department, Mr. Perry Hand, who has joined with us today and joins us for this testimony. Thank you very much for the opportunity. We have submitted the written testimony for the record, but I would appreciate the opportunity and I thank you for that opportunity to kind of summarize very briefly, in the interest of time, the statement that we have made in that testimony which represents many, many mayors and many, many elected officials from throughout.

As I mentioned, I am part of a large delegation today of elected officials, highway officials, of businessmen, planners and just private citizens who have joined with us from four states who have

come together on one single project. I will introduce those that traveled with us later so that you can also ask them questions.

The need for legislation, I think, is great at this time, as we have all agreed. Our infrastructure has many needs for refurbishment, maintenance, as well as expansion. The last time that legislation was as important as this was considered perhaps was in 1956. At that time, the interstate system was initiated and our area was left out, which was certainly understandable at that time. We had no crying need for an economic development four-lane limited access highway or to be a part, necessarily, at that time of the interstate system.

I am the Mayor of Huntsville, Alabama, the home of Congressman Cramer, which we are very, very proud of. A city that in 1956 had fewer than 15,000 residents. But times have changed. We in our city have become a major population center, as have many other cities along the Memphis to Atlanta economic development corridor. Our county alone is approaching a quarter of a million people, and the corridor has almost 5 million people in it.

As the testimony that I have presented states, that corridor has over 100 Fortune 500 companies, and that is excluding what is in Memphis and what is in Atlanta—just in between. It is a strategic, scientific and defense corridor with Redstone Arsenal, NASA's Marshall Space Flight Center, the Yellow Creek Advanced Solid Rocket Motor facility and others. We have excellent water, rail and air transportation, but not surface. We have in that corridor a tremendous share of the nation's poultry and agricultural markets. We have distribution facilities to serve the southeast and the nation for companies like Wal-Mart and Federal Express located there.

As a single case, the city of Huntsville alone has the highest average income of any city in the southeast. It has the second largest research park in the nation. And in the last ten years, we have added 50,000 jobs in just our area alone. The other cities along that corridor have had equal success stories. But today, you need a guide of some kind to get you to the largest cities to the west and to the east of us, Memphis and Atlanta.

Today, we come to you to ask you to recognize the vital importance of this project to the economic health of our nation. There may be other multi-state projects that reflect the changes since 1956. Surely, 35 years have seen growth in areas like ours.

Ladies and gentlemen, make no mistake about it. These multi-state projects will not be built unless you include them in this legislation. Alabama's Highway Director, Perry Hand, who I introduced earlier, is here with me today to help express that sentiment. He has graciously offered to convene and lead the four states' administrations and those highway department administrations. But without federal leadership and federal involvement, it will be very difficult. We are asking you to include in this legislation a multi-state project of a highway of national significance built to interstate specifications to begin immediately that would connect Atlanta and Memphis, and thus, Oklahoma City and all points west through Huntsville, with a connector to Chattanooga. That is our request today.

And I would like to just close with two quick points. Mr. Hammerschmidt, we welcome the University of Arkansas to the Southeastern Conference, and we would love to make it easy for them to be able to get—for your fans to get to the games. We certainly look forward to that. [Laughter.]

The other point I would make is that the Olympics will occur in 1996. Some of this project could be complete. We could certainly get a good beginning on that. Otherwise, all areas west of Memphis and all those going to the Olympics west of Memphis could drive over 200 miles of two-lane. Perhaps we need to make that an Olympic event in itself.

I would like to introduce to you, if I might, the members of our delegation who are here with us today and ask them, if they would, to stand up in case there are any questions that you would have of any of them also.

Senator Lowell Barron, who is the Deputy Chairman of the Finance and Taxation Committee of the State of Alabama Legislature.

The Mayor of Decatur, Alabama, a very progressive city next to us, who is President of the North Alabama Mayors' Association and Chairman of the North Central Alabama Council of Governments. That is Mayor Bill Dukes of Decatur, Alabama.

Mayor Ray Calhoun of Tuscumbia, Alabama, Chairman of the Northwest Alabama Council of Local Governments.

Mayor Lakin Collins of Athens, Alabama, who is a Director in our Top of Alabama Regional Council of Governments.

Mayor Walt Hamner from Scottsboro, Alabama.

Commissioner Buddy Rose from Lawrence County, Alabama.

In private business, Andy Lowery, who is the Regional Manager for Advanced Business Development of Lockheed Missiles and Space Company. They are responsible for the Yellow Creek facility in Iuka, Mississippi, the advanced solid rocket motor facility.

We have some of our administrative people, Dallas Fanning of our Planning Department. Rick Liles, my administrative assistant. And Ed Mitchell, Project Manager of Mitchell & Mitchell Consultants, who was introduced earlier.

From Mississippi, we have Bobby Scott, who is Chairman of the Transportation Committee of the Chamber of Commerce of Corinth, Mississippi.

And the Tennessee delegation, Tom Green, who is a consultant in Nashville, Tennessee.

We also have letters in the testimony from Mayor Hackett, the Governor of Tennessee, and the Lieutenant Governor, reflecting their support.

From Georgia, Representative Paul Smith, District 16, Georgia State Legislature, who is a member of the Legislative Transportation Committee, from Rome, Georgia. Napoleon Fielder, Vice Chairman of the Rome City Commission, Rome, Georgia. Mr. Jim Herrington, Commissioner from the Rome City Commission in Rome, Georgia. And Gary Tillman, who is Chairman of the Transportation Committee of the Greater Rome Chamber of Commerce. And also, Kevin Poe, County Manager.

And I would also mention that we have met with and have letters of support from Mayor Maynard Jackson from Atlanta in the testimony.

It has been our pleasure to have that opportunity to meet with you to give you our feeling that there is a definite need for multi-state projects of expansion type projects to be included in the legislation. We appreciate the opportunity to be with you.

Mr. MINETA. Thank you very much, Mr. Mayor, for your very fine testimony—for this very complete testimony, as well as the group that has accompanied you at this point.

Let me at this point yield to our very fine colleague from the 5th District of Alabama. Not only is Congressman Cramer a member of the Public Works & Transportation Committee, but of course, someone that is—another committee that is very closely aligned with the work that is connected with Huntsville, Alabama, and that is his membership on the Science, Space and Technology Committee. And as a first term member, Congressman Cramer has already made a very good impression on our two committees, as well as other members of the House of Representatives.

So at this time, I am proud to yield to our colleague from Alabama, Mr. Cramer.

Mr. CRAMER. Thank you, Mr. Chairman, for those kind remarks. Also, I will be brief. This group has worked for a long time on this project, and I congratulate you for that and congratulate you for attending this field hearing, which is important to this issue.

But since we have our State Highway Director, Perry Hand, here, I would ask you if you would take this opportunity if you would like, to comment about this piece of legislation because the project that we are speaking toward today is a multi-state project which presents a dilemma for several States. It also means that within a state budget, you have got budgetary issues that you have got to speak to. So, to members of Congress that would have a hand in drafting this piece of legislation, would you have some brief comments about those dilemmas.

Mr. HAND. Certainly. Thank you, Congressman. I would say, first of all, that certainly, budgetary constraints are going to be different in every state that we come across. I am here to tell you, number one, that the State of Alabama supports the project from the Atlanta/Huntsville/Memphis interstate concept. We stand ready to provide the necessary state funding for our share of the expense involved in this route. We pledge our support to developing the project and also its coordination. I think as proposed, the route would be—basically, Alabama would have more than any of the other states as far as miles are concerned because it goes almost through the entire State of Alabama connecting these other states. So, we would certainly be most happy to provide coordination from other state highway departments in the accomplishment of these projects.

Also, we feel that it is—that the designation of this route—a real designation in terms of legislation is so vastly important and that we have a name, a designation through the legislative process that will allow us then, to coordinate in that effort. At the present time, without delineation, it becomes almost impossible then for the states to come together to develop such a coordination effort. Here

is one place in a multi-state project where Congress can play such a major role in providing us with the leadership and the coordination that we need. And, so we request this probably most of all, that we do have a designation in the reauthorization bill for the highway concept.

Mr. CRAMER. Would that be a specific designation or——

Mr. HAND. Yes, sir. It needs to be a specific designation—the Atlanta/Memphis Corridor. And we would love for you to add the word "Huntsville." Atlanta/Huntsville Atlanta Corridor. [Laughter.]

Mr. CRAMER. Okay. Senator Barron, any comments that you would like to make on that issue as it relates to Congress and the state?

Mr. BARRON. Congressman, I would just like to say that I share the feelings of all my colleagues here, that we are very supportive of this route. This is the fastest growing portion of Alabama, the north Alabama area. And we have seen virtually a population explosion in the Huntsville/Madison County area. We need some connection to the various land routes, as the Mayor said earlier. So, we will support that at the state level, monetarily and through the administration.

Mr. CRAMER. Thank you, Senator Barron. I yield back to the Chairman. Thank you.

Mr. MINETA. Thank you very much.

Mr. Mayor, let me ask, what is the estimated cost of this Tennessee Valley interstate project?

Mr. HETTINGER. To my knowledge, there has not been an estimated cost done on the project.

Mr. MINETA. And has there been any kind of preliminary environmental analysis of this Tennessee Valley interstate highway corridor to sort of engage the feasibility of the construction of this project?

Mr. HETTINGER. No. As a matter of fact, you will notice that as we draw on the map, we have a fairly large corridor. We want to keep the options open to make the minimal environmental impact—the most positive economic route that would be feasible. And so it is, in our studies a fairly broad corridor—a swath on a map you might say.

Mr. MINETA. Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. Thank you very much, gentlemen, for your testimony.

Mayor Hettinger, little did we know when we sent Bear Bryant over to Alabama to teach the Southeast Conference how to do well that we would follow him in too, later on. [Laughter.]

But we are very impressed not only with this very comprehensive testimony, but with the size of the delegation that you have brought over here from the various States.

You know, Mr. Hand, you mentioned that the State of Alabama was ready to endorse this and put it into their Highway Transportation Development Plan, I would assume.

Mr. HAND. Yes, sir.

Mr. HAMMERSCHMIDT. I guess the important thing in this designation would be that Georgia, Tennessee and Alabama and their Departments of Transportation also put it into their plans. I would

think that would be fairly important. Do you know what their intentions are?

Mr. HAND. I believe they would, indeed, cooperate with us in this effort. That is one of the projects that I have set for myself to do, and that is to bring all of the different highway departments together in order for us to be able to stipulate that in writing. I think that would be a very important point for the Committee.

Mr. HAMMERSCHMIDT. It would be important. Well, we thank all of you and we appreciate you being in western Arkansas today. Thank you.

Let me make one other comment. I want to compliment Bud Cramer. He is a great member of our Committee. The other thing is, I never think of Huntsville, Alabama that I do not think of the former Chairman of this Committee, Bob Jones, and I am sure you see Bob. And please extend to him our very best wishes because he is one of our all-time favorites.

Mr. HETTINGER. Thank you.

Mr. MINETA. Mr. Shuster.

Mr. SHUSTER. No questions.

Mr. MINETA. Mr. Rahall.

Mr. RAHALL. No questions.

Mr. MINETA. Any other members of the panel who might want to question? If not, again, thank you very, very much for your presence here.

I would like to call forward a panel made up of Mr. F. S. Garrison, Chairman and Chief Executive Officer, Arkansas Freightways; Mr. Jerry Yarbrough, Senior Vice President of Operations, ABF Freight System and Mr. Charles Mudd, Vice President, Operations, Contract Freighters, Inc.

Gentlemen, your statements will be made a part of the record. And so, if you would go ahead and make your oral presentations, and Mr. Garrison, we will start with you.

**TESTIMONY OF F.S. GARRISON, CHAIRMAN AND CHIEF EXECUTIVE OFFICER, ARKANSAS FREIGHTWAYS; JERRY YARBROUGH, SENIOR VICE PRESIDENT—OPERATIONS, ABF FREIGHT SYSTEM, INC; AND CHARLES MUDD, VICE PRESIDENT, OPERATIONS, CONTRACT FREIGHTERS, INC.**

Mr. GARRISON. Mr. Chairman, Mr. Hammerschmidt, members of the subcommittee, I want to acknowledge at this point in time that I was born and reared and continue to reside in the home town of Congressman Hammerschmidt, and I am very, very proud of that fact. I remember John Paul when he was a kid growing up there in Harrison. [Laughter.]

I would like to mention that as president of a motor freight carrier, Arkansas Freightways, that we strive to be a good corporate citizen, to operate our units over the highway safely and to pay our fair share of taxes. And I think in these respects that we are like the great majority of responsible people in the trucking industry out there on the highways today.

I would like to go back, if I may, to the principle that we learned maybe in Economics 101, namely, that the terms "production" and "wealth" are synonymous. That without production, we have no

wealth. And all the gold in the world would be totally worthless if we did not have goods and services to purchase with that gold. Admittedly, of course, we have to strike some social balances. But as we find ourselves more and more competing in a global economy, it is absolutely necessary that we focus every available resource that we have at our disposal in that respect. Which means to my way of thinking that we also need to eliminate that which is not productive.

Only in America, for instance—and I am proud of our system of government—but only in America would we have 50 different systems of collecting motor fuel taxes and 50 different ways of collecting vehicle registration fees. We have made a little progress in that respect over the last several years, but it has come ridiculously slow and we absolutely must have federal action to eliminate this great burden on inter, and intra for that matter, state commerce that we experience in this country. We believe that competition—competition is good. I regard competition as the catalyst that rewards in the marketplace the effort that we put forth as business people.

And I would submit to you, since we have had deregulation—that occurred in legislation in 1980—deregulation of interstate commerce for hire motor carriers, that we have wound up with quite a bit more efficient interstate system of transportation of goods in this country. And that that is a great asset when it comes to competing internationally or globally, if you will. It is also good for the consumer and the working person in this country. Any time you are operating more efficiently, it is good for business.

I would like to see that deregulation extended to the states in their economic regulation of the intrastate commerce. That is one of the provisions of the Department of Transportation's proposed legislation, I note. And I think that that would be good for the whole country. It is kind of ridiculous to have a system half regulated and half not regulated. Now, I want to emphasize that I want to continue to see safety regulation, both at the interstate and intrastate levels. But when it comes to economic regulation, when we are are talking entry into business, when we are talking about regulation of rates charged users of motor freight carriers, I propose that we should be totally deregulated.

Furthermore, I would like to say that I am opposed—I am going to be opposite a lot of people on this. I am opposed to the application of highway user taxes to the toll road system. With recent passage of the five cents per gallon diesel fuel tax, I think that funding should be adequate for the foreseeable future. I would like to see us—again, as John Paul might say, I am preaching to the choir, but I would like to see us spend our trust funds on a current basis. It is rather ridiculous to see the deterioration that occurs among our highways when we have money sitting in a pot somewhere up in Washington that could be used to prevent that deterioration. Remember the old saying, "A stitch in time saves nine."

Also—I think I may again be preaching to the choir, but I feel like that the recent action where we had highway user funds diverted for purposes of attempting to balance the budget, it sets a dangerous precedent, and I would like to see that legislation expire on time and not be extended.

In conclusion, I would like to say that in this country, we have the finest transportation and distribution system in the whole wide world. You only have to compare our system to that of the U.S.S.R., where I am told, for instance, that the average length of haul by truck is nine miles. They almost have no system. Food rots in the fields while people starve. All we need to do is fine tune the system that we have. We need to maintain the highway system that we have. We need to be willing to make the necessary capital investments that make sense.

I appreciate the opportunity to be here, and I would be glad to answer questions at the appropriate time.

Mr. RAHALL. Mr. Yarbrough.

Mr. YARBROUGH. Thank you, Mr. Rahall. I am Jerry Yarbrough. I am Senior Vice President of Operations for ABF Freight System. ABF and its affiliates comprise the nation's fourth largest national motor carrier of general commodities. ABF has 327 terminals located in all 50 states, Canada and Puerto Rico and employs approximately 10,000 persons. 1990 revenue was 765 million dollars. ABF operates 3,500 power units and 11,000 twin trailers. Inter-city miles in 1990 totaled 237 million.

In light of recent information being disseminated pertaining to long combination vehicles, drug use in the trucking industry and highway wear caused by trucks, we feel it important to report our experience and position on these issues.

On the matter of long combination vehicles, in 1985, ABF commenced a shift toward the use of 28-foot twin trailers, versus 45-foot long single vans. During 1986, ample numbers of both types of vehicles were operated essentially under the same conditions. The rate of accidents reportable to the Department of Transportation for single long vans was 628,000 miles per accident, while it was 2,400,000 miles per accident for twin trailer combinations. The twin trailer rate has continued to improve.

ABF has utilized triple trailer combinations in the states of Idaho, Oregon and Utah since 1985. During the six years through 1990, ABF has operated triple 28-foot trailers 4.5 million miles and has been involved in two DOT reportable accidents.

Our experience proves that long combination vehicles do not have higher accident rates. On the contrary, twin trailers are four times safer than single vans and triple trailers are slightly safer than twin trailers.

On the matter of drug use, since mandatory drug testing became law in December of 1989, 3,680 ABF drivers have been screened for drugs during their DOT physical examinations. A total of seven individuals tested positive, which represents a rate of two-tenths of one percent.

A total of 2,055 job applicants have been screened for drugs since December of 1989 during pre-employment physical exams. There were 19 positives, which equates to nine-tenths of one percent.

Based on these total drug test results to date, the incidents of drug use that ABF has discovered is only a tiny fraction of what is purported by some to exist among truck drivers.

On the issue of highway wear, we believe that before a large investment is made to upgrade the U.S. highway system, it would be prudent to research the issue of pavement design and wear. If

pavement is found to be strongly dependent upon vehicle speed, ABF would support strict enforcement of a 55-mile-per-hour speed limit for tractor-trailer rigs.

That concludes my report. Thank you.

Mr. RAHALL [assuming the chair]. Thank you. Mr. Mudd.

Mr. MUDD. Thank you, Mr. Rahall. Congressman Hammerschmidt, Congressman Hancock, Committee members, I am Charlie Mudd. I am Vice President of Operations for CFI. I am glad to be here to personally make some comments on behalf of Contract Freighters, Inc.

Contract Freighters, Inc., CFI, is a privately held, irregular route truckload carrier started in 1951 and based in Joplin, Missouri. We operate more than 1,000 trucks and 2,500 trailers throughout the contiguous 48 States, all bordering Canadian provinces and Mexico as far south as the Yucatan Peninsula. We operate terminal facilities in nine U.S. locations.

As a trucking company, we are particularly interested in the structure and progress of the 1991 Surface Transportation Assistance Act. We are all aware the health and development of our nation's infrastructure is directly related to—and to a degree, can dictate the productivity and profitability of our economy. As a trucking company that handles a large amount of international freight, we see the quality and efficiency of our infrastructure as a key factor to our nation's participation and leadership in the quickly developing global market. We must maintain the ability to move goods and materials across our nation with the same, and even better, effective precision as other nations with less territory and better infrastructure investment. This is a thought that I will return to.

We believe this to be a vitally important topic. We also want to recognize the extremely difficult task you have in developing the United States' plans for the future in this area and I thank you again for the opportunity to add our comments today for your consideration.

First, CFI strongly supports any measures included in the act that ensure the maintenance and upkeep of the current highway system, with particular attention to bridges. A system to monitor the effective, efficient use of funds for these programs must be included.

CFI also supports efforts to encourage the construction of toll roads to fund new highways, allowing better utilization of tax monies. Tolls are an easier, more definite charge for a trucking company to deal with, and are in line with the general philosophy that a direct user pays the fee.

Our first preference is for the toll to be eliminated, or at least reduced to a minimum maintenance fee once construction costs are covered. If the tolls are then continued, excess revenues absolutely must be specifically designated for highway system purposes.

In the same light, all of the present trust fund monies and all highway and fuel tax dollars designated for the needs of our infrastructure at no time and under no circumstances should be used for any other purpose, including efforts to balance the federal budget. All of these funds should be released and used for their intended purposes. I am singing in the same choir here.

We believe the number of adequate rest areas should be addressed. I have read comments to the effect—or to the point of private industry being involved in the development of rest areas. And we want the number of rest areas to be addressed just as well. It is common to see trucks and cars parked along the entrance and exit ramps at night for lack of adequate rest areas. Some States will ticket a vehicle parked on a ramp, when there is really no other place to rest. This is an important safety issue for both truckers and motorists.

Finally, I want to discuss a local topic. Southwest Missouri and western Arkansas have a strong interest in upgrading Highway 71 as part of the interstate highway system. With a plan of connecting Kansas City and Shreveport, and better still, Houston, Texas through Joplin, Fort Smith—or through Joplin, Missouri and Fort Smith, Arkansas, a valuable corridor to CFI, the local economies and the previously described international market will be developed. This lane is currently needed for existing traffic and would quickly grow into a major commercial lane. CFI supports any efforts to develop the Highway 71 corridor.

I believe here is where I can add some unique comments to the topic today. I am certainly in agreement with the comments already made in support of Highway 71 development. Let me add, nearly 40 percent of CFI's revenues are generated from the transport of international freight. We haul freight from Canada to Mexico, Mexico to Canada, all kinds of U.S. origins to international shipping ports. We haul freight from New York to Mexico City. We are currently hauling freight from the Brownsville/McAllen area in Texas coming out of Mexico up into the midwest. We avoid this area of the country with those routes because of an inadequate highway system.

I have attended seminars held by the U.S. Commerce Department to assist and encourage private companies in their participation in international trade. The Highway 71 corridor would greatly help businesses in the heart of America participate in the international global marketplace by connecting the midwest with Gulf port cities. In that light, the Highway 71 project is consistent with Commerce Department efforts to develop export trade and help balance the trade deficit.

Chairman Mineta, I tell you that southwest Missouri does share the enthusiasm for this project that Arkansas is showing you right now, and you asked that earlier.

Thank you once again for the opportunity to express our concerns, and please feel free to contact myself or anyone at CFI to participate in these forums.

Mr. MINETA [assuming the chair]. Very well. Thank you very much. I apologize for not having been here for all of your presentations.

Mr. Garrison, let me ask you about something you indicated, and that was support for measures that would require states to make motor carrier fuel use and registration requirements more uniform. How many individuals does your company employ to just handle registration, fuel use reporting and what is referred to as bingo stamp compliance for your company?

Mr. GARRISON. Well, as far as—we have about 2,700 people, and as far as the number of people directly involved in purchasing bingo stamps, fuel tax——

Mr. MINETA. Registration of vehicles, fuel use reporting.

Mr. GARRISON [continuing]. Fuel decals, registration—as far as the people involved in reporting and purchasing, about five people. But you have to remember that the application of these decals and stamps, the maintenance of the bingo cards out in the field and all of that takes a lot of time from a lot of people. So, the equivalency would be probably more like 30 or 40 people if you took the people that do that on a part-time basis.

Mr. MINETA. And, Mr. Yarbrough, critics of longer combination vehicles claim that they are more prone to accidents in severe weather. Does ABF have any policy relating to operation of triples during rain, during snow, high winds? Do you allow the triples to be pulled empty, or do they have to be pulled—and with that excellent record that you indicated in your testimony about your own accident records utilizing the triples, four and a half million miles involved in two DOT reportable accidents. Are you—do you have special drivers on these rigs? I would like to sort of hear what you are doing there to have this kind of enviable great record.

Mr. YARBROUGH. I am not sure that our record is remarkably different from other carriers. The perception that triples are unsafe is, as far as I know, not founded on anyone's statistics. The practice of ABF is to put the decision making on safe driving at the driver level. We spend a lot of time and effort training our drivers and making them understand that they are in charge of handling that rig safely. There are certain parameters that we use to restrict a triple from going out on the highway. High winds or snow or ice would preclude the use of triples. However, if a driver is out on a run with triples and he gets into a situation with sudden rain or high wind, he is responsible for, and in fact, will pull off and not continue in those circumstances. ABF has no desire to rush ahead in an unsafe condition. The drivers are "captains of their ships" so to speak, and they—they are taught and delegated the responsibility of driving safely. This, by the way, is not limited just to triples. We do not pull doubles—particularly empty doubles—in high winds or adverse weather either.

Mr. MINETA. Earlier, we had a witness who indicated that if this 71 north-south corridor were more readily available to be a toll road, similar to the toll roads in Oklahoma—with that suggestion, would any of you wish to make any comments on whether or not there would be any support for this if this were a toll road facility? Any thoughts on that?

[No response.]

Mr. MINETA. Next question?

Mr. HAMMERSCHMIDT. You may not have been here when Mr. Garrison made his comment.

Mr. MINETA. Oh, I am sorry.

Mr. GARRISON. Speaking for Arkansas Freightways, we would be opposed to the use of highway user fees on toll roads.

Mr. MINETA. Okay. Very well.

Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. I thank all of you for very good statements.

Jerry, you mentioned in your testimony that more research should be dedicated to pavement design and wear. Do you believe that the trucking industry would support stronger and thicker pavements designed to be more durable over time if, indeed, the upfront construction costs were higher as a result, which they obviously would be?

Mr. YARBROUGH. Yes. I would support, first, research to determine what the parameters of pavement wear are. It may be that more attention to the sub-base construction and drainage would greatly extend the life of the highways. But in answer to your question directly, yes, we would be in favor of additional money for additional durability and reliability to highways.

Mr. HAMMERSCHMIDT. Sheridan, do you have any thoughts on that? I know engineering and design of highways is a little out of your line, but you are the greatest users of them, so we would be interested to know what you think.

Mr. GARRISON. Well, it is not totally foreign to me. We have 112 terminals and we have to do pavement design for those terminals. And so, it is not totally foreign. But let me just say that with respect to the thickness of pavement to withstand heavier loading, you need to remember the fact that that is only a small percentage of the total cost of highways. If you start with the actual procurement of the land for the rights of way to build the highways and you go through the design process, the bidding process, all the way through to the signage that goes on the highways and the grass that is mowed along the highways and the traffic signals and everything else that goes, the pavement thickness—a few inches more of pavement thickness is only a small incremental amount, only—I have heard it said only a couple of percentage points of the total cost of new highways.

Mr. HAMMERSCHMIDT. So, a pretty good investment, then?

Mr. GARRISON. A pretty good investment, yes sir. Thank you.

Mr. HAMMERSCHMIDT. Mr. Mudd.

Mr. MUDD. I would just add that the eventual benefit of that is absolutely everyone, not just the trucking companies.

Mr. HAMMERSCHMIDT. Thank all of you.

Mr. MINETA. Mr. Shuster.

Mr. SHUSTER. Thank you for your testimony.

Mr. MINETA. Mr. Rahall.

Mr. RAHALL. No questions, Mr. Chairman. Thank you.

Mr. MINETA. Mr. Nichols.

Mr. NICHOLS. I would like to ask a question, Mr. Chairman. Mr. Yarbrough, in your testimony, which I thought was very good, you had indicated that if more research were done into the pavement design and wear of the heavy rigs, that your firm would support strict enforcement of a 55 mile an hour speed limit. Would this be uniform with a motor carriers association or your fellow partners in motor carriers, would also support that, or are you speaking only for yourself?

Mr. YARBROUGH. I am not sure I am speaking for 100 percent of the regulated motor carriers, but I am fairly confident that of the more well-known regulated motor carriers and the association—the

American Trucking Association—that that would be the majority. In fact, Sheridan is telling me here that he is in favor of that. And incidentally, ABF has governors on its road tractors and we govern our tractors to a top speed of 58 miles an hour right now. We drove 237 million miles last year at that regulated top speed.

Mr. NICHOLS. And that is on a 65-mile-an-hour——

Mr. YARBROUGH. Generally, 65. There are some portions of heavily traveled interstates which are 55. But by and large, throughout the country, our trucks are governed to run no faster than 58.

Mr. NICHOLS. Mr. Garrison or Mr. Mudd, any comment?

Mr. MUDD. I would add my support to that in the same way. The most efficient use of our equipment is at that speed as well.

Mr. NICHOLS. I see. Mr. Garrison.

Mr. GARRISON. I agree.

Mr. NICHOLS. Okay. With, of course, the expansion of the highway program, money going into it, inevitable deterioration taking place, of course, and your—that was based on the predication that if the research shows that to be the case.

Mr. YARBROUGH. Yes, sir.

Mr. NICHOLS. Thank you very much.

Mr. MINETA. Mr. Hancock.

Mr. HANCOCK. No questions.

Mr. MINETA. Mr. Zeliff.

Mr. ZELIFF. No questions, Mr. Chairman.

Mr. MINETA. Ms. Molinari.

Ms. MOLINARI. I have no questions.

Mr. MINETA. Well, let me thank again all of you for making your presentation to us. Let me ask just very quickly, on this speed issue, you do that with onboard machines in terms of some kind of tachometer or something else to govern these trucks?

Mr. YARBROUGH. We have—on ABF's—on two-thirds of ABF's fleet, we have mechanical governors which shut the engine down at approximately 58 miles an hour. On one-third of the fleet—the newest third of the tractors are computer controlled to shut down at 58 miles an hour, which is an absolute speed control.

Mr. MINETA. Mr. Garrison.

Mr. GARRISON. Our trucks are governed mechanically at 59 miles per hour. On the latest trucks that we have, which are electronically controlled and have cruise controls, they are set to operate at 55 miles per hour.

Mr. MINETA. Very well. Hopefully, those semi-conductor chips that control that come from Santa Clara County. [Laughter.]

Thank you, very much. I appreciate it.

At this point, I would like to call forward a panel made up of Ann Henderson, Executive Director, Arkansas Transit Association; Keith Jones, Executive Director, Central Arkansas Transit Authority and Taunya Kopke, Director, Ozark Public Transit.

We are pleased to have all of you here. Your statements will be made a part of the record. And Ms. Henderson, if you would start off.

**TESTIMONY OF ANN HENDERSON, EXECUTIVE DIRECTOR, ARKANSAS TRANSIT ASSOCIATION; KEITH JONES, CENTRAL ARKANSAS TRANSIT AUTHORITY; AND TAUNYA KOPKE, DIRECTOR, OZARK PUBLIC TRANSIT**

Ms. HENDERSON. Thank you, Mr. Chairman and members of the Committee. My name is Ann Henderson. I am the Executive Director of the Arkansas Transit Association. I appreciate you letting me testify before you today on the importance of public transportation in our state and how critical federal assistance is to make this basic service available for all Arkansans.

Our association represents over 100 transportation providers supported by the Urban Mass Transportation Administration, including four Section 9 small urban systems and eight Section 18 rural systems. These 12 public transportation providers serve only 25 of the 75 counties in Arkansas. There are approximately 100 paratransit agencies that service their own clientele of elderly and handicapped citizens.

Transportation costs have risen significantly over the years. The price of vehicles has increased; maintenance and operating costs, including higher minimum wages, insurance and fuel, will make it impossible to provide the current needed services on current funding levels.

We recognize and support the need for good highways. However, more federal assistance for the transportation of people is critical. Arkansas ranks third in the nation in the percentage of elderly population and near the top in the total number of disabled. In addition, we rank first in motor fuel consumption per registered vehicle.

For every gallon of gas purchased, one and a half cents goes into the mass transit account to fund transit programs. In 1988, Arkansas paid over fourteen and a half million dollars into this account. We got back less than $600,000. Arkansas ranked 50th in the nation that year in return of those funds. In 1989, Arkansas motorists paid more than $17 million. We got back $760,000. In other words, for every dollar we paid, we got back four cents. And with the new federal gas tax, we are going to be paying more than $25 million. Our return will be less than three cents for each dollar contributed. Arkansas truly is a donor state.

There appears to be a bias toward the federal funding formulas for the rail systems. While appropriate for the larger cities, most of the country needs adequate funding for buses and vans. We need an equitable and guaranteed return of mass transit account funds to the states, similar to that for highways. That percentage is now 85 percent. Also, states need the flexibility of using these funds for the Section 18 rural program.

Urban and rural systems depend upon operating assistance. A reduction of these funds would certainly have a devastating effect.

Arkansas is basically a rural state. Forty-two of our counties in the eastern half are part of the lower Mississippi River Delta region, including some of the poorest counties in the country. Out of those 42 counties, public transportation is available in only six.

Dr. Joycelyn Elders, Director of the Arkansas Department of Health, said recently that the greatest barrier to health care in Ar-

kansas is transportation. That people who can afford transportation have health care, but people cannot get it if they cannot get to the service.

To illustrate, let me tell you what happened a few months ago at one of our rural systems, Mid-Delta Transit in Helena, which is located on the Mississippi River. A 15-year-old girl with a newborn baby met the bus at its scheduled stop in Marvell, a small community a few miles out of town. Even though she did not have enough money for the fare, she asked if she could ride the bus for 15 miles to take her baby to the doctor. The driver probably stretched procedures by letting her ride free, but it was lucky for the baby that she did because the doctor hospitalized him immediately for a life-threatening illness. The child survived, but the outcome would have been much more tragic if that transportation had not been available.

Recently, Congressman Ray Thornton of Arkansas called for more support for public transportation in rural areas. He said, "We need to improve public transit and we need to strengthen the federal commitment for those people who cannot afford the most expensive form of transportation known to man, which is everybody jumping in his own car and going."

In Arkansas, this private form of transportation is not available to a significant number of citizens. These are the transportation dependent. It does not matter how much we spend on highways, these people cannot benefit because they cannot use them.

Although the Administration's proposal goes some distance in recognizing the necessity for funding rural providers and those serving the elderly and handicapped, we feel it does not give enough support. There is a proposal before you recently introduced by Congressman Rahall and cosponsored by Congressman Beryl Anthony from Arkansas and over 30 members of your colleagues, including a dozen members of this Subcommittee. This bipartisan effort goes even further to support the public transportation crisis, and in our judgment, deserves your very serious consideration. I am talking about H.R. 1079, the Mobility Assistance Act of 1991.

This Act would increase assistance for public transportation across the board. No one loses and everyone wins. For states like Arkansas, it helps target increases for small urban, rural and para-transit providers that have been historically underfunded. Our own Senator, David Pryor, intends to introduce this important legislation in the Senate.

We applaud the Administration's recognition that the name of UMTA should be changed. However, I personally support a change to the Federal Public Transportation Administration, as provided in the Mobility Assistance Act. I fight the perception everyday that our state does not have mass transit. As one state senator put it, "We ain't got no subways in Arkansas." It is difficult to convince our local citizens that the same pot of money paying for the big city rail systems also helps their mom get to the senior center.

As jobs, goods and services move to regional areas, we cannot afford to leave behind the poor, the elderly, disabled and willing workers. Only through expanded and improved public transportation services can these people reap the rewards of opportunities available to them.

Today, it is easier for someone to get from East Berlin to West Berlin than it is for some people to get from West Memphis, Arkansas to Memphis, Tennessee.

As we focus on our future, it is imperative that transportation issues go beyond the emphasis on moving vehicles to include strategies for moving people. Thank you.

Mr. MINETA. Mr. Jones, if you would go ahead and proceed.

Mr. JONES. Thank you, Mr. Chairman. My name is Keith Jones and I am the Executive Director of the Central Arkansas Transit Authority. We are from another Congressional district, but we feel right at home here because Congressman Hammerschmidt and his staff have been so helpful to us over the years.

We operate a 50-bus system on 31 routes in Little Rock, North Little Rock urbanized area. We served over 3.2 million passenger trips last year, and we have an operating budget of $4.5 million a year.

We are a member of the American Public Transit Association and the South West Transit Association. I am sure you have heard the position statements of our interest groups, and I am not going to repeat those here and dwell on them. I do want to give you the viewpoint of a manager of a small to medium transit system.

The vast majority of our riders have no car available for their travel needs. Their life must revolve around where the bus can take them and when it can take them. In our city, that means they have to have their travel complete by 6:30 at night. And they do not travel at all on Sundays or holidays.

From where we sit, the federal role that you are addressing in this reauthorization bill has been shrinking over the last ten years. In 1981, the Section 9 appropriation for CATA was $1,032,000. Ten years later, the Section 9 appropriation was $1,029,000 that is, the operating cap. During that same ten years, our budget increased 39 percent. The CPI increased 41 percent. Our federal operating assistance actually decreased by $2,000 over that ten years.

We remained in business only by virtue of rapid increases on behalf of our local government and through fare increases. I believe I am safe in speaking—and I would not be safe if I returned to Little Rock without saying this—that our local governments are asking that steps be taken by Congress to reach a balance in the roles once again.

Transit is being asked to help meet many national goals—clean air, less dependence on foreign oil and providing mobility to persons with disabilities. We are glad to be asked and we hope we are up to the challenge. We have been putting wheelchair lifts on our buses since 1981. We started a paratransit system for persons with disabilities three years ago. We just hope we have enough money to operate the paratransit system that may be mandated by the ADA.

As I mentioned, we have a struggle to match the operating funds, and I want to address the proposal of the Administration to change the matching capital from 80/20 to 60/40. Last year, we were able to buy our first new bus in seven years. We may have enough matching money to buy two this year. The average age of our fleet is 12 years. UMTA, which is a very cooperative federal agency, felt so sorry for us in Little Rock, that they transferred 12 buses from Oklahoma City last year that were ten years old that

Oklahoma City was getting ready to scrap. That improved the average age of our fleet. If the capital matching requirement is raised from 20 to 40 percent, we will simply be priced out of the market of matching funds. We will not be able to buy federal capital funds.

I also cannot see the logic of the Administration's proposal that will restrict the operations assistance, whatever its level, to only certain expenditures like tires and parts and not fuel and labor. Our riders will not be served at all if we have great tires and new transmissions, but we do not have enough money to buy fuel or if we have to lay off drivers.

As I understand the reauthorization bill being addressed by this Subcommittee, we are in agreement that the federal funding for transit should begin in 1992 at around $6 billion or more and that it should increase and not decrease over the next few years. If all we have to agree on now is how fast it should increase, I think we are in a very fortunate situation.

I want to address and echo Ms. Henderson's comments on equity in the mass transit account. The lack of equity makes it difficult to ask the local governments and the voters for more money. They do not understand why a poor rural state has to subsidize expensive rail systems around the country.

If I could depart from my written remarks, a few years ago, the MPO did a study of light rail in Little Rock. Little Rock is not ready for light rail, but the study did point out that in spite of lack of passenger densities, Central Arkansas Transit would gain almost a million dollars a year by virtue of operating a rail line—a million dollars a year in Section 9 assistance. In other words, it would pay us to get a car and run it, whether it had passengers or not, along a 33-mile existing Rock Island track, just to change our role in the formula. We have not done that, but we are tempted at times.

The large transit systems obviously need federal assistance, and we do not want to get to where we are competing within our own community of transit providers. But the current programs so heavily favor a few states and a few large systems that the lack of equity is becoming a major issue. Bus systems, in my opinion, actually have a harder job than the big rail systems in that we are trying to provide a service in areas that grew up around the automobile, whereas the rail systems are providing a service in areas that grew up around the rail systems.

We believe there should be increased support to the Sections 18 and 16.b.2 providers also. We think transit throughout the area, whether it is an urbanized area or rural area, is important. We are very supportive of the goals of the Mobility Assistance Act, and its provisions to help the small urban and rural operations will go a long way toward addressing that equity problem. We think our riders deserve a first-class transportation mode, and we think that to address some of the national goals, we are going to have to have a first-class transit system. I would hope that your work on this reauthorization bill will help us achieve that. Thank you.

Mr. MINETA. Thank you very much, Mr. Jones.

Ms. Kopke.

Ms. KOPKE. Mr. Chairman, members of the Committee, my name is Taunya Kopke. I have been the Director of Ozark Public Transit since 1986. Ozark is a community transit system operating in four

northwest Arkansas counties. We operate 37 small buses and vans and we employ 30 people, mostly part-time. We also depend on volunteers. We serve an area with a population of about 230,000 people and provide about 210,000 demand-response rides a year. Most of our riders are persons with disabilities, senior citizens or factory workers.

We are supported by UMTA's Section 18 program and by the Section 9 Governor's Apportionment Program. And I hope during the reauthorization process, you will recognize the success of UMTA's efforts in rural and small urban communities and that we will be able to rectify some of the problems that rural and small urban communities experience with UMTA.

We operate one of about 1,200 rural transit systems in the nation. The benefits of public transit for elderly rural people are just what you would expect to see in any big city. One of our passengers responded to a recent survey, "It makes it possible for me to buy my groceries, pay my bills, take care of myself in a lot of ways all on my own. It helps me keep my independence, and I am all for that."

The benefits of public transit for younger rural passengers are equally important. Just as public transit for impoverished neighborhoods in big cities opens the door to advancement for urban people and supports the expansion of urban economies, so providing it in rural and small urban communities assures the advancement of rural people and furthers the development of rural and small urban economies.

Employers in northwest Arkansas tell me that continued economic growth in our region depends in part on finding employees for the jobs that are created and that many available workers have no transportation of their own. And county social services administrators in Arkansas confirm this. They are charged with administering the Welfare Reform Act, which requires welfare recipients to work, and that Act is going to succeed in communities where there is public transportation and it is going to fail in communities where there is not public transportation.

UMTA's 12-year-old policy of support for rural and small urban transit has, I think, demonstrated that rural communities do have mobility problems and that those problems can be solved.

I think we also have some unique problems. One is the equity issue, and you have heard about that already. The Section 18 program has been allocated less than 3 percent of UMTA's general fund appropriation to serve the mobility needs of 38 percent of the population. And Arkansas, along with other states, I am sure, has a serious problem in terms of the mass transit account. We support the enactment of the Mobility Assistance Act.

Another issue is planning and technology. Transit technology training and transfer, research and planning, I think, focus too much on large-scale, big-bus solutions to mobility problems, which do not adapt very well to our rural needs. And so, I am hoping that there will be increased funding for planning and for RTAP.

Another area is regulations. And one that I would recommend that is written for a large bus system is the $5 million insurance criteria for Interstate Commerce Commission authority. That regulation makes it virtually impossible for rural public transit systems

to operate across the state line because our buses are too small to justify $5 million in liability insurance, and it costs—it just costs too much to get that kind of insurance and we do not have that kind of liability in the first place. And what it means is that unemployed people in Oklahoma cannot work in Arkansas where the jobs are, even though the commuting distances may be very small. The elderly residents of Bentonville cannot go to the Azalea Festival in Muskogee and that retirees in Bella Vista, which is up in the corner of Arkansas, cannot have regular service to Carthage or Springfield in Missouri. And I would hope that you would consider exempting Section 18 operators from the ICC requirements.

Another problem is the matching requirements. And I think that UMTA's local match requirements really act to discriminate against rural and small urban transit systems because the majority of them are so small that they do not—they are not able to operate their own systems. As I said, in our area, we serve four counties, and I enclosed a list with my testimony of all of the local governments in my region. There are 43 of them, which means that if I am going to secure matching funds for the UMTA program, I really should request funds from 43 elected bodies, submit 43 budgets, attend 43 hearings, prepare 43 sets of reports and maintain an accounting system designed to track revenues and costs for 43 different auditors.

In reality, what happens is that most rural and small urban match is provided by human service agencies who have to divert funds from some other form of direct service they are really wanting to provide. The matching funds leave us—requirements leave us struggling to serve people who are not anyone's client. And they present some financial and administrative nightmares as well. And these problems are not really shared by our large urban counterparts, who simply submit a bid each year to an elected body with taxing authority.

I would conclude by saying that while Section 18 and Section 9 have done much to help develop strategies and technologies for meeting rural and small urban mobility needs, we operators often feel like we are wandering around in the dark because the federal commitment to rural and small urban systems has thus far been so limited. And I am hoping that it will be recognized as important to rural development and to other national objectives as well.

I thank you for the opportunity to speak.

Mr. MINETA. Thank you very much, Ms. Kopke.

Ms. Henderson, in addition to the changes proposed by Mr. Rahall's bill which you support, do you have any specific suggestions regarding changes to the current allocation formulas which would ensure Arkansas a greater share of UMTA dollars?

Ms. HENDERSON. It is not enough.

Mr. MINETA. Total amount?

Ms. HENDERSON. The total amount is not enough. I think we get about 4 million now. I believe it would be between 6 and 7 million we would get under the proposal. Seven million will not carry our current needs. And as you recall, I said that there was public transportation in only 25 of the 75 counties in our State. There is absolutely no room for growth and expansion and improvement.

Mr. MINETA. Thank you.

Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. I know we are running very short on time, but I want to thank all of you for your testimony on mass transit. We wanted to make sure we had a mass transit panel here.

The funding inequities are so apparent in UMTA funding as it pertains to Section 9 and Section 18. The titles that you deal with, in my opinion, they must be changed. You just get the short end of the stick. You talk about donor States. When you talk about UMTA donor states, we are really one. We are at the bottom of the list. We are 50th. So, I hope that my colleagues can see that and we can reason together and try to change that formula some way to be helpful.

Thank you very much.

Mr. MINETA. Mr. Shuster.

Mr. SHUSTER. Even though Pennsylvania is one of the beneficiaries of this unfair formula, I really think it is so grossly unfair that it does have to be changed, and I will work with Congressman Hammerschmidt to try and do that.

Mr. MINETA. Mr. Rahall.

Mr. RAHALL. Thank you, Mr. Chairman.

I knew there was a reason I liked coming to Arkansas besides the suggestion of Congressman Hammerschmidt that we come here. We do have a lot in common, Arkansas and West Virginia. And your testimony, all of you, in support of 1079, the Mobility Assistance Act, is deeply appreciated. You have given vivid examples of how it affects our senior citizens, how it affects our handicapped, how it affects our working men and women and the very uneven ball playing field upon which we play today. And your testimony was just right on point, and I thank you for it very much.

Mr. MINETA. Ms. Molinari.

Ms. MOLINARI. I am just curious as to what your average fare is right now. For example, Mr. Jones, how much do you charge to ride?

Mr. JONES. Our fare is 80 cents. The average fare paid with discounts for elderly and handicapped works out to around 45 or 50 cents.

Ms. MOLINARI. Thank you.

Mr. MINETA. Mr. Cramer.

Mr. CRAMER. No questions, Mr. Chairman.

Mr. MINETA. Mr. Nichols.

Mr. NICHOLS. Thank you very much for your testimony.

Mr. MINETA. All right, thank you very, very much Ms. Henderson, Ms. Kopke and Mr. Jones.

At this time, I would like to call on Mr. Gordon Kinch, Manager of Legislative and Regulatory Affairs for the James River Corporation and Mr. Frank Buchanan, Logistics Development Manager, Weyerhaeuser Company.

Mr. Kinch, your statement will be made a part of the record. So, if you would go ahead and make your oral presentation.

**TESTIMONY OF GORDON KINCH, MANAGER, LEGISLATIVE/REGULATORY AFFAIRS, JAMES RIVER CORP.; AND FRANK BUCHANAN, LOGISTICS DEVELOPMENT MANAGER, WEYERHAEUSER CO.**

Mr. KINCH. Thank you, Mr. Chairman. We at James River, of course, have a significant Dixie Cup facility here in Fort Smith and are pleased that we were invited to present comments here.

We depend upon the highways. Hence, all of the testimony that was made earlier regarding engineering and infrastructure needs, I completely echo. I do not pretend to be an engineer. My agenda is a very simple one.

Like you, James River supports a multi-year reauthorization plan which stresses need for better coordination among the nation's transportation modes and recognizes the impacts that highways have on competitiveness. I believe that strikes out, Mr. Chairman, on one of your main themes as you introduced the panel earlier. Facilitating intermodalism is an important step in improving U.S. productivity and widening market opportunities for our goods, both at home and global commerce. Identifying and providing adequate funding for the major highways for the flow of commerce is another important step in this process. I will preach to the choir. James River supports taking the highway trust fund off budget to better ensure that these revenues are spent for their intended purposes.

There is one element James River respectfully requests be incorporated into any reauthorization plan approved by your Subcommittee. The proposal would greatly enhance the efficiency of our nation's trucking industry and make the United States highways a full partner in increasing U.S. productivity. It is supported by the Administration and certain members of your Committee.

James River is asking that your highway reauthorization legislation include all the provisions contained in H.R. 1064, the Safe and Competitive Trucking Act of 1991, and Sections 508 and 305 of H.R. 1351, the Administration's Highway Reauthorization Plan. These provisions represent billions of dollars in increased productivity by eliminating duplicate paperwork requirements that have no clear, safety or other public interest benefit. Their enactment would help the trucking industry better fulfill its potential in meeting James River's intermodal needs by giving it additional flexibility in tailoring service packages better to meet our customer needs.

I would like to take just a moment on this word "customer." At James River, we have many, many customers. Some of our customers have come to James River asking that this provision be included. So as I speak here, it is not just a James River request. It is the many thousands of customers that we have that may purchase the Dixie cups or whatever products that we distribute nationwide, worldwide. We are a constituent of everyone, whether we have a plant in your state or not. When our product passes through the chain—the logistics chain—we become a constituent. So that everyone is a constituent.

Waste is a word that is not mentioned in here, but it is a word that our President, Mr. Bob Williams of the James River Corporation, is tackling. In our company, the word "waste" is not very rev-

erent. If the application of H.R. 1064 in total were put to bed here and the highway reauthorization, you could cut down on the waste in America considerably.

James River appreciates this opportunity to present our views. We look forward to working with you and your staff on this important issue so that the country benefits from the safest, most efficient national highway system possible. If James River can be of any further assistance, please do not hesitate to contact me. Thank you.

Mr. MINETA. Very well. Thank you very much, Mr. Kinch.

Mr. Buchanan, your statement also will be made part of the record. If you would, go ahead and proceed.

Mr. BUCHANAN. Thank you. Mr. Chairman, members of the Committee, my name is Frank Buchanan. I am Manager of Logistics Development for Weyerhaeuser Company in Hot Springs, Arkansas. Weyerhaeuser is a diversified forest products company engaged in the production, manufacture, distribution and marketing of lumber and paper products throughout the United States. Weyerhaeuser operates five major facilities in Arkansas, and we employ approximately 2,800 Arkansans.

I appreciate the opportunity to testify on H.R. 1351, the Highway Reauthorization legislation. I am here today to urge you to continue the federal leadership in the development and maintenance of our highway system and to encourage you to include in reauthorization legislation provisions that will enhance the productivity of motor carriers utilizing that system. We are competing in a global marketplace, and with our transportation costs representing between 10 and 20 percent of the total delivered cost of goods, we feel it is vital that the infrastructure and those operating on it are safe, efficient and productive.

This can be accomplished by legislation reauthorizing the federal funding and participation in the development and maintenance of our highways. We also request that the provisions of a bill that was introduced this year by Congressman Dennis Hastert, H.R. 1064, the Safe and Competitive Trucking Act of 1991, be included in the reauthorization bill. We understand that many of the provisions in H.R. 1064 are included in the Administration's bill H.R. 1351. Congressman Hammerschmidt, we understand from our Washington office, supports the inclusion of economic deregulation of motor carriers in the highway reauthorization legislation, and we would like to personally thank him for his support and look forward to working with him on this issue that is important to all of us.

The inclusion of H.R. 1064 would ensure the implementation of the President's national transportation objectives to enhance and improve productivity and efficiency of the motor carrier industry. The bill has two areas of emphasis. First, the application of interstate regulation over interstate carriers while operating in intrastate transportation. Second, consistent taxation of motor carriers operating in all jurisdictions, not to eliminate taxes, but to provide uniformity in tax application.

A recent House of Representatives Government Operations Committee report supports this approach.

I would bring Report 101-813 to your attention where it states on page 22 of its findings:

The productivity and operating efficiency of interstate motor carriers and brokers of property are unnecessarily adversely affected by state and local economic regulations. Taxes and fees that are non-uniform, inequitable and discriminatory in form and process.

Also on page 23 in its recommendations, it is stated,

Congress should preempt the state's authority to regulate interstate, private and for-hire motor carriers and interstate brokers which provide intrastate transportation of property.

We support all aspects of the Hastert bill, but I would like to focus on the application of interstate regulation over intrastate transportation.

We at Weyerhaeuser rely heavily on the motor carrier industry to provide highway transportation services. In 1990, over 200,000 truckloads of raw material and finished goods moved in and out of our facilities at a cost in excess of $100 million. Here in Arkansas, 15,000 truckloads moved to and from our facilities. Today's regulatory environment does not always provide the efficiencies needed by these motor carriers.

Over 40 States continue to regulate the economic aspects of intrastate trucking. This creates internal trade barriers within the United States, which results in higher costs for intrastate versus interstate shipments of similar distance. I would like to share a couple of examples of how this impacts Weyerhaeuser in Arkansas.

At Dierks, Arkansas, it costs us 12 percent more—roughly 19 cents more per mile, to move a load of lumber from Dierks to West Memphis, Arkansas versus the same load from Dierks to Memphis, Tennessee, which is virtually the same distance. Using the same scenario, it costs Weyerhaeuser approximately 20 cents more per mile, a 10 percent increase, to move a load of plywood from Mountain Pine, Arkansas to here in Fort Smith versus Mountain Pine to Poteau, Oklahoma, which is virtually the same distance.

I would like to also call to your attention when Mr. Renard testified—Mr. Renard, President of Briar Gypsum, he mentioned in his testimony that potential customers in the northwest part of Arkansas tell him it is easier, cheaper and better for them to buy their material from western Oklahoma, which is an additional 100 miles away, rather than buy from him. And I would point out that we are familiar with the Briar operation and that a large part—a large reason that the customers would indicate the higher cost is the intrastate regulation of transportation costs.

These examples point out the inefficiencies of the current system created by intrastate regulations. There is another example I would like to share with you. This does not directly impact Weyerhaeuser, but certainly impacts the country's competitiveness. Steel imported to the port of Seattle costs $14 a ton to move to Spokane, Washington. Steel produced in Seattle destined to Spokane costs $18.40 a ton, a difference of 31 percent in transportation costs. This again points out the disparity between intrastate and interstate regulations and certainly yields a freight advantage to foreign competition.

There is obviously a need for the reauthorization legislation and all related transportation proposals to become more market oriented and international in their outlook. U.S. goods compete with

those made in foreign countries, and they do so both inside our country, as well as in global markets.

In closing, I would once again urge reauthorization of the federal funding of our highway system and inclusion of the provisions of H.R. 1064, which are consistent with the President's national transportation objectives. Weyerhaeuser supports your efforts, and I am grateful for the opportunity to testify today. Thank you.

Mr. MINETA. Thank you very much, Mr. Buchanan. Mr. Buchanan, you have observed that over 40 States maintain restrictions of some nature on intrastate movements by motor carriers. What elements of transportation are regulated by the States—routes, rates, commodities—and how consistent are the States in the degree of regulation that they impose?

Mr. BUCHANAN. Well, they regulate all the aspects that you mentioned. And just to deviate for one moment, I believe that earlier when our trucking panel—I believe it was Mr. Garrison that made mention that he would like to see deregulation of the rates charged and our other trucking panel members also mentioned the inefficiencies of their operation. And this certainly—when you talk about intrastate regulation—impacts the efficiencies of their operations. The rate structure is regulated. There is not an ease of entry into the marketplace and there is no uniformity whatsoever.

Mr. MINETA. Mr. Shuster.

Mr. SHUSTER. I have no questions.

Mr. MINETA. Mr. Rahall.

Mr. RAHALL. No questions.

Mr. MINETA. Any other members of the panel wish to ask questions? If not, Mr. Kinch and Mr. Buchanan, thank you very much for your presence here in helping our Subcommittee.

At this time, I would like to call forward a panel made up of Mr. Bob Crafton, Member, Board of Directors, Arkansas Good Roads Transportation Council; Mr. Ben Hogan, President, Ben M. Hogan, Company and Conway Massey, Chairman, New Generation Committee, Arkansas Oil Marketers Association.

Mr. Crafton, we will have you start for us.

## TESTIMONY OF BOB CRAFTON, MEMBER, BOARD OF DIRECTORS, ARKANSAS GOOD ROADS TRANSPORTATION COUNCIL; BEN HOGAN, PRESIDENT, BEN M. HOGAN CO., INC.; AND CONWAY MASSEY, CHAIRMAN, NEW GENERATION COMMITTEE, ARKANSAS OIL MARKETERS ASSOCIATION

Mr. CRAFTON. Thank you, Mr. Chairman. My name is Bob Crafton and I am a member of the Arkansas Good Roads Transportation Council. I want to tell you how pleased we are that we could be here and make this statement.

The Transportation Council, of course, is a private non-profit highway betterment association, as many state have. We have been in business here for about 15 or 20 years. Our membership is composed of a broad base group of Arkansans whose common goal is a better road system for Arkansas and, of course, the nation. We appreciate being here.

A central question facing the State of Arkansas today is how to ensure adequate investment in its highway system to meet the

present and future demands for economic growth or business development and for safe travel. And I was pleased, Mr. Chairman, to hear earlier in your testimony about the goals of your Committee and some of the things you want to accomplish by this Committee and to see that public safety and quality of life, of course, and some others were included in that.

You have heard testimony all morning. We know you are tired, and I am not going to be very redundant and mention a lot of things because many of the issues that we have—we want to talk about have already been talked about. But I do want to point out three or four things.

This fact that Arkansas is a donor State is hard for some of us lay people to understand where we only get 70 cents of every dollar that we pay in. It is hard to explain that to the man on the street out here, as you may well understand. But the shortage of funds is even compounded more when you consider that Arkansas, being a small state in population—we have about—less than 2.5 million people. We generate fewer revenues because of lower traffic volume. We are a rural state. We do not have any real large cities, as perhaps you may be used to. Therefore, the total sales of motor fuel is much less. In fact—and we use more fuel. The average Arkansan today will use 1,100 gallons of fuel this year. That is more than—that is the highest of any State in the Union. We have to buy a lot of fuel individually.

And being a donor State, we have helped contribute to our economic deprivation in lots of ways—witness the Delta region. You have heard testimony today that five out of these Delta States, including Arkansas, are donor States. And we just find it hard to see the fairness for these donor States to suffer while subsidizing other states.

Another point I want to make is that we—the Good Roads Transportation Council recommend that the Federal Government release to Arkansas its equitable share of the federal funding. At the present time, the 85 percent minimum allocation is not even being met, we understand. We would like to see that increased.

The AGR/TC believes that the Federal Government should maintain the integrity, of course, of the trust fund. You have heard comments on that today. And we would like to see you release some of these accumulated funds.

The AGR/TC recommends that the Federal Government spend down this trust fund. By law, the trust funds can be used for no other purpose than transportation. If we could spend down that, if we could release some of that, then work could begin now to prevent some costly repairs.

We strongly oppose the use of federal fuel taxes for deficit reduction purposes. I believe last fall when your Committee was here, Mr. Chairman, I believe it was you that predicted there would be a federal gas tax. And of course, there has been and we understand the need for a federal gas tax, but it is hard for us to understand why part of the federal gas tax should go toward reducing our deficit. We just cannot afford to continue to divert this type of revenue to other government spending.

The AGR/TC recommends that the law be changed so as to direct all revenues derived from the federal motor fuel taxes to the highway trust fund.

And we also believe, in closing, that the funding rates for the urban—rural/urban program should remain at the current level of 75/25. We know that proposed in legislation, it just may go to 60/40.

The Arkansas legislature meets twice a year. They meet for 60 days plus at the beginning of each odd year. They just passed a gas fuel tax increase. To pass taxes in Arkansas requires three-fourths of the members of both the house and senate, and they did that. They did that because they believe that we need money for roads and because our constituents out in the rural areas were willing to pay additional gas tax to fund roads. But, now we see that the federal participation may be lowered from 75/25 to 60/40. So now, the gas tax that we are going to pay—that we are glad to pay if it goes to roads—we are going to see it watered down and not go nearly as far as we had hoped. We hope something can be done to keep that 75/25 as it is.

So in closing, we know that you have a tremendous challenge before you. We know that you are faced with groups like us everywhere you go, always wanting something. And you have to balance the interest in all the legislation that you pass, and we sympathize with the job that you have. We just want you to know that we think the transportation needs in Arkansas are tremendously important, and we want to assist you in making that the top priority here in Arkansas. Thank you, Mr. Chairman.

Mr. MINETA. Thank you very much, Mr. Crafton.

Mr. Hogan, your statement will be made a part of the record. And, if you will proceed in your own fashion. But before you start, I just want to thank you for your service really with the AGC. We have had an opportunity to meet before and to discuss a lot of our mutual problems and issues, but I just want to thank you for the leadership you have shown over the years in your work with AGC. So if you would, go ahead and proceed, Mr. Hogan.

Mr. HOGAN. Thank you, Mr. Chairman. I do appreciate that. And, John Paul, it is nice to see you again and other members of the Subcommittee. I am Ben M. Hogan, a contractor from Little Rock, Arkansas. Today, I represent the Arkansas chapter of the Associated General Contractors of America and also the national office of the Associated General Contractors of America. I served as President of the Arkansas chapter and President of the national organization.

The Arkansas chapter has 94 contractor members and 201 affiliated members engaged in the contracting business in Arkansas. AGC is a national trade association of more than 32,000 firms, including 8,000 of America's general contracting firms. AGC represents—excuse me—AGC appreciates the opportunity to express its views on issues facing the nation on surface transportation. AGC believes this nation must increase investments in its surface transportation infrastructure to provide the foundation for continued economic prosperity and international competitiveness.

As the 102nd Congress gets underway, we applaud this Subcommittee for scheduling these hearings and getting on with the im-

portant task of reauthorizing the nation's highway and mass transit programs. AGC is also very encouraged that President Bush and Transportation Secretary Skinner have placed transportation as a top priority of the Administration's domestic agenda. We commend you, Mr. Chairman, in the leadership of the House Public Works and Transportation Committee, for taking the initiative earlier this year to propose an aggressive five-year, $153 billion budgetary framework for the future funds of our nation's surface transportation programs. AGC believes the Committee's budget request is on the right track to improve and expand the efficiency of our nation's highways and bridges and make a substantial federal commitment towards addressing the documented annual highway capital needs of all levels of government of $58.5 billion per year. It can also make a critical difference in the state of the U.S. economy now and in the future. Included in AGC's statement for the record are a number of recommendations which we offer to the Subcommittee for its consideration in development of the legislation. I would like to briefly highlight only a few of the recommendations.

User fee trust fund concepts. The critical element which has led to the success of the Federal Aid Highway Program is the user fee finance trust fund mechanism which is used to support it. This concept must be retained for a successful future program. Maintain the gas tax for transportation purposes. AGC strongly urges the Congress to reject any further proposal to increase the gasoline tax for deficit reduction or non-transportation spending. AGC further urges the Congress to place the 2.5 cents now going into the general fund for deficit reduction in the highway trust fund to be used for much needed highway and bridge improvements. AGC supports Congressional efforts to increase funding for the nation's highway program through spending down the trust fund balance, increasing the highway user fees and elimination of the tax exemption for gasohol.

Funding flexibility between highway and transit programs. AGC is concerned about the provisions in the Administration's bill which provides state and local governments the flexibility to transfer funding between the highway and transit programs. AGC continues to believe that the revenues placed in the highway account of the trust fund must be expended solely for highway improvements. Current revenues are insufficient to meet the documented highway needs.

Equitable distribution of funding. AGC believes that two concepts contained in the current program assures all States a certain level of equity in the distribution of funds. They are the .5 percent minimum apportionment and the 85 percent minimum allocation provisions. AGC endorses the overall concept of guaranteeing small and rural states the minimum level of total federal spending to support their highway programs. AGC equally endorses the concept of guaranteeing a minimum level of return of trust fund contributions to states which through the formula process receives significant less in apportionment than they contribute into it.

Special preference programs. AGC urges that the Congress sunset the current DBE program which results in the denial of subcontracts to many individuals because of their race, gender or national origin.

In closing, AGC acknowledges that the Congress faces a tremendous challenge in balancing the interest in the future legislation and stands ready to work with the Congress as it develops solutions to the nation's national transportation infrastructure crisis.

Thank you, Mr. Chairman.

Mr. MINETA. Thank you very much, Mr. Hogan.

Mr. Massey.

Mr. MASSEY. Good afternoon, Mr. Chairman and Congressman Hammerschmidt and members of the Subcommittee. I appreciate the opportunity to testify today. My name is Conway Massey, and I am General Manager of Littlefield Oil Company. Littlefield Oil is a wholesale distributor of gasoline and diesel. It supplies fuel at approximately 185 outlets. Twelve of these outlets were built to serve the interstate highway traveler. Six of these outlets are truck stops.

I am appearing today as a representative of Petroleum Marketers Association of America, the PMAA, and the Arkansas Oil Marketers Association, the AOMA. PMAA is a federation of 44 State and regional trade associations representing more than 11,000 independent petroleum marketers. The Arkansas Oil Markets Association has represented wholesale distributors since 1942 and its members sell half of the gasoline and diesel consumed in Arkansas. I would like to thank you for selecting Arkansas as a site for receiving testimony today.

Reviewing highway programs and planning for the needs of the country at this time of revenue shortages is particularly difficult. Because of this urgent need for additional revenues, the petroleum marketing industry fears that the President's proposal to lease land at rest areas or along the interstate will be considered attractive. Currently, such leases are prohibitive. We believe that this proposal would cause substantial damage to small businesses, such as Littlefield Oil, who are now selling gasoline and diesel at interstate interchanges. And we, therefore, oppose Section 306 of H.R. 1351.

First, additional stations are not necessary along the interstate system. At most highway interchanges, service stations have been constructed to serve the motoring public, and many operate 24 hours a day. Nearly every available and economically viable interchange has been developed. Mr. Chairman, competition for the motorist is vigorous at these interchanges, with a variety of businesses competing for the passing motorist. This vigorous competition leads to lower gasoline prices and customer convenience. We believe the present system serves the motorist very well.

Allowing a state to lease land along the interstate would be extremely harmful to our members and seriously undermine the investments they have made adjacent to the interstate. Sites on the interchange are usually leased or sold at two to ten times the amount of sites not on the interchanges. While competition should always be encouraged by the Congress, my business cannot fairly compete if I bought a piece of property based on the assumption that it would be the best site to serve the motorist, when just down the road, a rest area begins selling fuel right on the interstate. When I buy a site at an interchange, I pay a premium for it. I also know that I must sell high volumes of fuel to stay in business.

Opening the rest area to commercialization will undercut the marketing decision that I made when I picked that location and will probably prevent me from selling high volumes that I need. Without the high volumes, I cannot afford to pay rent, taxes or wages to my employees.

An additional problem with allowing new commercial development on the interstate is the Highway Beautification Act. Through the efforts of Congress, much of the interstate system is well landscaped and is free from commercialization. Billboards are prohibited in many areas. And in many cases, there are no effective means of advertising services to the public. Under the present system, I advertise my stations through an official signage program. Shortly before the exit, I am allowed to rent space on an official interstate sign. On this sign, the brand of gasoline is indicated, but there is no mention of price. In contrast, a rest area will be advertised for many miles through the State's rest area signs, and the facility itself will be readily visible from the interstate. A motorist driving the interstate may not even know that I am selling fuel at a competitive price just down the road. The motorist will become a captive customer of the rest area facility. I do not know how an independent businessman can compete in that situation.

A final concern of our members is that they may be financially excluded from ever participating in leases along the interstate if this prohibition is removed. A State interested in leasing service station space along the interstate easement would probably attempt to lease all sites to one bidder to minimize administrative costs. Or one major oil company may try to lease all sites in one state. In either case, there will be fewer suppliers of fuel and less competition.

In conclusion, the original Interstate Authorization Act clearly established that the interstate system would not be a commercial corridor. Businesses, including marketers, have relied on that decision to construct facilities at interchanges and to continue to make substantial investments to maintain and improve those facilities. A sharp change in the rules at this time would not be fair to these businesses who have and who will continue to provide public services. PMAA and AOMA respectfully urges you to oppose any proposal which would allow commercial development on the interstates, including Section 306 of the President's proposal.

We thank you for your consideration of this matter, and I will be happy to provide any answers to questions you might have.

Mr. MINETA. Thank you very much, Mr. Massey. Let me ask with regard to your statement, do you believe a State's leasing revenues from commercial rest area establishments would outweigh the potential loss in income and property taxes from businesses such as yours that might occur if rest areas were permitted to be commercialized?

Mr. MASSEY. Yes, we do. Once those sites come into being, the value at those interchanges as far as the service stations and convenience stores, truck stops, are going to depreciate considerably. And we do feel like that we would lose the property value, as well as the business and volume and all those things.

Mr. MINETA. So, this idea of, let us say, the State just leasing to XYZ Corporation or to ABC Oil Company would be—as you say, it

would reduce their administrative costs, but this would really reduce the potential competition then.

Mr. MASSEY. Absolutely. We feel like—and have a little bit of basis in some other situations—that if that became available and if the State began to lease out those properties, that the local State jobbers would not be able to get a piece of that pie, largely because we would not have enough money to make the bids to do that, in many cases. Most of our jobbers in our organizations are smaller and could not make that type of investment. So, we feel like the larger oil companies would gain and the independent petroleum distributors would lose.

Mr. MINETA. Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. I want to thank all of you for your very professional and helpful testimony.

Ben, let me ask you, you mentioned that a high percentage—over 80 percent of all America's personal travel, commuter travel, freight traffic, occurs on our highway system. In a rural State like Arkansas, I know this is particularly true. Now, you are wearing two hats today. I guess you are wearing the Arkansas hat and maybe the national hat, but——

Mr. HOGAN. Hopefully, yes.

Mr. HAMMERSCHMIDT [continuing]. With your Arkansas hat on, in light of these statistics, what is your view of allowing significant amounts of highway funds to be eligible for transit projects?

Mr. HOGAN. I am very much against that. I think we have got a tremendous shortage of highway funds now. And it seems to me the last study showed, as a nation, we ought to be spending $58 billion; we are only spending $31 billion. And I do not see how you can take away from that for mass transit. It appears to me that mass transit in Arkansas does deserve a different formula, perhaps something similar to the 85 percent minimum return that we now have in the highway part of it.

Mr. HAMMERSCHMIDT. Thank you.

Bob, you mentioned toll facilities, allowing 35 percent to be used there. I have lost track. Do we now have statutory authority yet in the State of Arkansas? Did the State act to allow us to do that?

Mr. CRAFTON. There was nothing in the last session of the legislature, I do not believe, Mr. Hammerschmidt. If they did, they did it in previous years. Of course, our highway commission is the turnpike authority, as you know, but I am not sure about the legislation. I will research that for you and respond to you.

[Mr. Crafton's response may be found on page 2250.]

Mr. HAMMERSCHMIDT. I remember at one time, you know, we had a separate turnpike authority and turnpike commission years back in the early 60's. You know, toll roads are something of interest to us at the federal level, and I am just speaking about Arkansas. But, I would assume that we would want to leave ourselves some flexibility there in our legislative process at the State level.

Mr. CRAFTON. Absolutely. We have discussed before in meetings such as this, I believe, the possibility of future legislation allowing federal funds toward toll roads also. And that would make many of our roads perhaps eligible. It would make them self-sufficient. We are comparing 412, for instance, that butts up against Oklahoma. But Oklahoma has had turnpikes for 40 years, and some have been

very successful, and they have left those tolls on those. And now, they are subsidizing other toll roads. And that makes them be able to build other toll roads, just like the Cherokee Turnpike. It has about the same traffic as our 412 over against the Arkansas line, but it will be subsidized by the turnpike between Tulsa and Oklahoma City and others. So, any type of legislation there would be good for us.

Mr. HAMMERSCHMIDT. Well, thank you very much, Bob, for your testimony.

Thank you, Mr. Massey.

Mr. MINETA. Mr. Shuster.

Mr. SHUSTER. No questions, Mr. Chairman.

Mr. MINETA. Mr. Rahall.

Mr. RAHALL. No questions.

Mr. MINETA. Any other members of the panel wish to direct questions to the panel?

[No response.]

Mr. MINETA. Well, let me thank again Mr. Crafton, Mr. Hogan and Mr. Massey for your presentation here today. I appreciate it.

If there is no further business then before the Subcommittee, we would like to thank very much the folks here in Fort Smith. Again, Bill, thank you very much for your wonderful hospitality. To Ray, from Mr. Hammerschmidt's office, again thank you. And to everyone else from this area who has been so generous and so hospitable to us. We are going to come back. Thank you.

The Subcommittee stands adjourned.

[Whereupon, at 12:41 p.m., the Subcommittee was adjourned.]

Weyerhaeuser

PREPARED STATEMENTS

OF WITNESSES

P.O. Box 1250
Hot Springs, Arkansas 71902

**STATEMENT BY**
**FRANK BUCHANAN**
**WEYERHAEUSER COMPANY**
**BEFORE**
**THE U.S. HOUSE OF REPRESENTATIVES**
**COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION**
**FORT SMITH, ARKANSAS**
**APRIL 22, 1991**

Mr. Chairman, Members of the Committee:

My name is Frank Buchanan. I am Manager of Logistics Development for Weyerhaeuser Company in Hot Springs, Arkansas. Weyerhaeuser is a diversified forest products company engaged in the production, manufacture, distribution and marketing of lumber and paper products throughout the United States. Weyerhaeuser operates five major facilities in Arkansas, and employs approximately 2800 Arkansans. My responsibilities include providing safe, efficient, cost effective transportation services to and from our facilities.

I appreciate the opportunity to testify on H.R. 1351, the Highway Reauthorization legislation. I am here today to urge you to continue the Federal leadership in the development and maintenance of our highway system and to encourage you to include in reauthorization legislation provisions that will enhance the productivity of motor carriers utilizing that system. We are competing in a global marketplace, and with transportation costs representing between 10 - 20% of the total delivered cost of goods,

it is vital that the infrastructure and those operating on it are safe, efficient and productive.

This can be accomplished by legislation reauthorizing the Federal funding and participation in the development and maintenance of our highways. We also request that the provisions of a bill that was introduced this year by Congressman Dennis Hastert (R-IL), H.R. 1064, The Safe and Competitive Trucking Act of 1991, be included in the reauthorization bill. We understand that many of the provisions in H.R. 1064 are included in the Administration's bill (H.R. 1351).

The inclusion of H.R. 1064 would insure the implementation of the President's national transportation objectives to enhance and improve productivity and efficiency of the motor carrier industry. The bill has two areas of emphasis:

- First, the application of **inter**state regulation over **inter**state carriers while operating in **intra**state transportation.
- Second, consistent taxation of motor carriers operating in all jurisdictions, not to eliminate taxes, but to provide uniformity in tax application.

A recent House of Representatives Government Operations Committee report supports this approach. I would bring House

Report 101-813 to your attention where it states on page 22 in its findings: "The productivity and operating efficiency of interstate motor carriers and brokers of property are unnecessarily adversely affected by State and local economic regulations, taxes and fees that are non-uniform, inequitable, and discriminatory in form and process. Also the report on page 23 in its recommendations stated: "Congress should preempt the State's authority to regulate interstate private and for-hire motor carriers, and interstate brokers, which provide intrastate transportation of property."

We support all aspects of the Hastert bill, but I would like to focus on the application of interstate regulation over intrastate transportation.

Weyerhaeuser relies heavily on the motor carrier industry to provide highway transportation services. In 1990, over 200,000 truckloads of raw material and finished goods moved in and out of our facilities at a cost in excess of $100 million. In Arkansas 15,000 truckloads moved to and from our facilities, most via regulated motor carriers. Today's regulatory environment does not always provide the efficiencies needed by our carriers.

Over 40 states continue to regulate the economic aspects of intrastate trucking. This creates internal trade barriers within the United States, which results in higher costs for intrastate vs. interstate shipments of similar distance. Let me share with you

two examples of how this impacts Weyerhaeuser in Arkansas (maps attached).

- It costs Weyerhaeuser 19 cents more per mile, or an additional 12% to move a load of lumber from Dierks, Arkansas to West Memphis, Arkansas; vs. Dierks to Memphis, Tennessee, which is virtually the same distance.
- It also costs Weyerhaeuser 20 cents a mile more, a 10% increase to move a load of plywood from Mt. Pine, Arkansas to Fort Smith, Arkansas; vs. Mt. Pine to Poteau, Oklahoma, which is the same distance.

These examples point out the inefficiencies of the current system created by **intra**state regulations. There is another example I would like to share with you. This doesn't directly impact Weyerhaeuser but certainly impacts the country's competitiveness.

- Steel **imported** through the Port of Seattle costs $14/ton to move to Spokane, WA.
- Steel **produced** in Seattle destined to Spokane, costs $18.40/ton, a difference of 31%.

This again points out the disparity between **intra**state and **inter**state regulations and certainly yields a freight advantage to foreign competition.

There is obviously a need for the reauthorization legislation

and all related transportation proposals to become more market-oriented and international in their outlook. U.S. goods compete with those made in foreign countries, and they do so both inside our country, as well as in global markets.

In closing, I would once again urge reauthorization of the Federal funding of our highway system and inclusion of the provisions of H.R. 1064, which are consistent with the President's national transportation objectives.

The challenge of this reauthorization legislation is to create a national highway system which enhances commerce and the general well-being. Weyerhaeuser supports your efforts and I am grateful for the opportunity to testify today. If you have any questions, I will try to answer them. Thank you.

The Honorable John Paul Hammerschmidt
U. S. Representative
P. O. Box 1624
Fort Smith, Arkansas 72901

Dear Congressman Hammerschmidt:

Submitted herewith are copies of the comments of the Arkansas Good Roads/Transportation Council regarding the proposed Reauthorization of the Surface Transportation Act.

We are grateful to you for hosting the Field Hearing of the House Public Works and Transportation Committee in your home District. It will allow members of the Committee to get a first hand look at Arkansas' highway needs.

Thank you for this opportunity to submit the Council's comments. Please let me know if additional information or clairfication is needed.

Very truly yours,

Bobby E. Bogard

Bobby E. Bogard
President

ARKANSAS GOOD ROADS/TRANSPORTATION COUNCIL

P. O. Box 6

LITTLE ROCK, ARKANSAS 72203

APRIL 22, 1991

COMMENTS ON THE PROPOSED

SURFACE TRANSPORTATION ASSISTANCE ACT OF 1991

---The funds available for the National Highway System (NHS), under the proposal, are actually less than current funds available for the Interstate and Primary System. Not until FY 1996 will the funds available for the NHS under the proposal surpass those which are available under the current (1987) Highway Act for interstate and primary.

The House Public Works and Transportation Committee has proposed a $153 billion Highway Bill as compared to the $89 billion funding level contained in the administrations proposal. The Committee's $153 billion proposal is much more in line with actual needs and we strongly endorse the increased amount.

---The limit of 150,000 miles in the National Highway System falls short of the needs. Arkansas would stand to lose about 3,000 miles from its highest level system. A system of 200,000 miles would be more in line with what is needed and the AGR/TC recommends that amount.

---The federal/state funding ratio for the Bridge program should be retained at 90/10. In these times of cutbacks at all levels of government, it will be very difficult for state and local governments to meet an increased share requirement. In addition, the funding allocation for the bridge program is inadequate.

---The proposal to allow up to 35 percent of the funding for toll roads to come from the federal government is a good move. However, public user fee supported financing and the principle of awarding construction contracts through the competitive bidding process must remain the cornerstone of our national highway improvement program.

---The proposal contains no provision for a minimum allocation to states. Assurances have been made by the Federal Highway Administration that appropriations to the states will be approximately 95% of the state's contributions to the Highway Trust Fund. In order to insure that states receive their equitable distribution of funds, the minimum allocation provision should be retained. A minimum allocation provision of 95% is hereby recommended. Likewise, the transit programs should have a minimum allocation provision. Seventy percent is recommended as an equitable minimum allocation.

In closing, let me say that the Arkansas Good Roads/Transportation Council is generally satisfied with the intent of the Administration's proposal. However, we are very concerned about the several matters mentioned above. We urge you to give these matters due consideration when fine tuning the proposed Surface Transportation Assistance Act of 1991.

Thank you for allowing us to share our thoughts with you.

Respectfully submitted,

Bobby E. Bogard
President

PRESENTED AT THE APRIL 22, 1991
CONGRESSIONAL HEARING IN FORT SMITH, ARKANSAS
HOUSE SUB-COMMITTEE OF SURFACE TRANSPORTATION

STATEMENT OF

BOB H. CRAFTON

REPRESENTING THE ARKANSAS GOOD ROADS/TRANSPORTATION COUNCIL

Mr. Chairman, members of the Transportation Sub-Committee, fellow council members. My name is Bob Crafton, a member of the Board of Directors of the Arkansas Good Roads/Transportation Council (AGR/TC).

The Council is a private non-profit highway betterment association. Membership is composed of a broad based group of Arkansans whose common goal is a better road system for Arkansas and the nation.

We appreciate the opportunity afforded us to express the Good Roads Transportation Council's views on the critical nature of funding for Arkansas' highways.

A central question facing the State of Arkansas today is, "How to ensure adequate investment in its highway system to meet present and future demands for economic growth, business development, and safe travel for our residents and visitors?"

We believe there are several issues that need to be re-emphasized regarding funding for Arkansas' transportation system.

1. ARKANSAS IS A DONOR STATE TO THE FEDERAL HIGHWAY TRUST FUND. We currently receive only about 72¢ for every dollar that our motorists pay in the form of Federal fuel taxes. If Arkansas were to get back all of the revenue it put into the federal highway program, our highways would not be in such a bad state of disrepair. The shortage of funds is even compounded when you consider that Arkansas, being a much smaller population, rural state, generates fewer revenues because of lower overall traffic volume, resulting in less total sales of motor fuel. On the other hand, the average Arkansas

motorist uses 1100 gallons of fuel per year, the highest average per motorist usage of any state in the nation.

Arkansas, being a donor state, has contributed to its economic deprivation; witness the Delta region. Five of those delta states, including Arkansas, are donor states. We do not believe it is morally fair for Arkansas to suffer as a donor state while subsidizing those states that receive more than their fair share.

2. The AGR/TC RECOMMENDS that the Federal Government release to Arkansas its equitable share of federal funding. At the present time, the 85% minimum allocation provision is not even being met.

3. THE AGR/TC BELIEVES THAT THE FEDERAL GOVERNMENT SHOULD MAINTAIN THE INTEGRITY OF THE TRUST FUND and not use it to prop up the federal budget deficit. Releasing these accumulated funds would make funding possible for several critical highway projects in Arkansas.

4. THE AGR/TC RECOMMENDS that the federal government spend down the trust fund. Holding on to the money just does not make good sense. By law, the trust funds can be used for no other purpose than transportation. Bankrolling these funds is not only a breach of faith with Arkansas transportation users, it is also postponing work that should be done now to prevent more costly repairs.

5. The AGR/TC strongly opposes the use of federal fuel taxes for deficit reduction purposes. The highway needs of Arkansas are so severe that we cannot afford to continue to divert this revenue source to other government spending. The federal deficit fuel tax is also disproportionate, putting a greater burden on rural states like Arkansas where more people must rely heavily on personal vehicle travel for both

work and leisure.

The recently enacted law increasing federal motor fuel taxes by 5c per gallon and diverting one half of that for deficit reduction purposes is a breach of faith with the American people.

6. The AGR/TC recommends that the law be changed so as to direct all revenues derived from federal motor fuel taxes to the Highway Trust Fund. Further, we support the proposed spend down of the Highway Trust Fund, even at a faster pace that currently proposed.

7. The AGR/TC believes that the funding rates for the rural/urban program should remain at the current level of 75/25. The proposed change to 60/40 would severely restrict the ability of rural states such as Arkansas to take part in the program.

In closing, the AGR/TC recognizes the tremendous challenge Congress faces in balancing interests in future legislation and stands ready to work with members of Congress to address these funding problems. We should all agree though, that the transportation needs of Arkansas, as well as other states, should be our top priority to ensure the nation's growth and competitiveness.

Thank you for the opportunity to express our thoughts on funding for Arkansas' highway system.

Bob H. Crafton, Member
AGR/TC Board of Directors

Hon. John P. Hammerschmidt
U.S. House of Representatives
2207 Rayburn Road
Washington, D. C. 20515

Dear Congressman Hammerschmidt:

First of all, we want to thank you for holding the public meeting of your Surface Transportation Sub-Committee in Fort Smith. We appreciate the opportunity to express our views concerning the proposed legislation being considered.

You asked me the status of turnpike legislation and I was not able to give you a definitive answer. Subsequent to that hearing, I have obtained copies of the current statutes for your use:

1. 1973 - Arkansas Turnpike Authority Act
2. 1989 - Act 192, giving the State Highway Commission the authority to undertake projects.
3. 1991 - Act 547, authorizing the State Highway Commission under certain conditions to transfer Federal funds to the Turnpike Authority.

It appears to us that the above legislation should be sufficient to allow toll roads to be constructed and maintained in Arkansas.

With Federal legislation that would allow supplemental Federal-Aid to tollroads, there may be certain routes in Arkansas that could qualify.

Thank you again for holding the hearing. We trust this information will be beneficial to you.

Sincerely,

Bob H. Crafton

(c) All highway revenues transferred to the State Highway and Transportation Department Fund under the provisions of this subchapter shall be used for the construction, reconstruction, and maintenance of highways and bridges in the state highway system.

**History.** Acts 1965 (1st Ex. Sess.), No. 39, § 5; 1967, No. 11, § 1; 1967, No. 41, § 1; 1967, No. 417, § 1; 1968 (1st Ex. Sess.), No. 10, § 1; A.S.A. 1947, § 76-334.

### 27-70-208. Disposition of gross receipts taxes on gasohol.

The gross receipts taxes levied and collected on gasohol, which was exempted from the motor fuel tax by §§ 26-55-205 and 26-55-207 and Acts 1965 (1st Ex. Sess.), No. 40, Ch. 2, § 2 [repealed], shall be used by the State Highway and Transportation Department to defray, in whole or in part, the cost of constructing, widening, reconstructing, maintaining, resurfacing, or repairing the public highways, and retiring highway indebtedness of this state. These taxes shall be remitted to the State Highway and Transportation Department in accordance with this subchapter.

**History.** Acts 1981, No. 865, § 1; A.S.A. 1947, § 76-334.1.

## CHAPTER 71
## TURNPIKES

SUBCHAPTER.
1. General Provisions.
2. Arkansas Turnpike Authority.
3. Turnpike Project Revenues.
4. Turnpike Revenue Bonds.

### Subchapter 1 — General Provisions

SECTION.
27-71-101. Title.
27-71-102. Construction — Scope of authority.
27-71-103. Definitions.
27-71-104. Ad valorem tax exemption.
27-71-105. No right of any character created until sale and delivery of bonds.

**Effective Dates.** Acts 1973, No. 312, § 26: Mar. 13, 1973. Emergency clause provided: "It is hereby found and declared that the construction and operation of turnpike projects, as authorized by this Act, are required for the public health, safety and welfare because of the increase of commerce and vehicular travel essential to individual and State progress and prosperity. The moneys now available are insufficient to permit the construction of turnpike projects that can be constructed under the authority of this Act. The realization of the public benefits sought to be accomplished by this Act depends upon the prompt undertaking of the acts authorized hereby. Also, prompt action is necessary to coordinate planning and construction with similar projects in other states. Therefore, it is declared, for these reasons, that an emergency exists and this Act, being essential for the preservation of the public peace, health and safety, shall take effect and be in force from and after its passage and approval."

---

## 27-71-101. Title.

This chapter may be referred to and cited as the "Arkansas Turnpike Authority Act."

**History.** Acts 1973, No. 312, § 1; A.S.A. 1947, § 76-2401.

## 27-71-102. Construction — Scope of authority.

(a) This chapter shall be construed liberally. All acts and activities of the authority authorized by this chapter are legislatively determined and declared to be essential governmental functions.

(b) In this regard, it is determined and declared that this chapter is the sole authority necessary for the performance of the acts authorized, including, without limitation, the issuance of bonds.

(c) The authority is empowered to take such action and do or cause to be done such things as shall be necessary or desirable to accomplish and implement the purposes and intent of this chapter according to the import hereof with the action taken by the authority or the things done or caused to be done by the authority pursuant to the provisions of this section being determined and declared to be ministerial rather than legislative in nature.

**History.** Acts 1973, No. 312, § 22; A.S.A. 1947, § 76-2423.

## 27-71-103. Definitions.

As used in this chapter, unless the context otherwise requires:

(1) "Authority" means the Arkansas Turnpike Authority created by this chapter;

(2) "Project" or "turnpike project" means any express highway constructed under the provisions of this chapter by the authority, including, without limitation, lands, rights-of-way, bridges, tunnels, overpasses, underpasses, interchanges, entrance plazas, approaches,

toll houses, service stations, administration buildings, storage buildings, other buildings, and facilities which the authority may deem necessary or desirable for the operation of a turnpike project, together with all property, rights, easements, rights-of-way, and interest that may be acquired by the authority for or in connection with the construction or operation of a turnpike project. Each turnpike project shall be separately designated by appropriate name or number and may be constructed, reconstructed, or extended in sections and stages as the authority may from time to time determine;

(3) "Costs" or "project costs" embraces all direct and indirect costs incurred in connection with the acquisition of rights-of-way for and constructing and equipping turnpike projects including, without limitation, the cost of the acquisition of all lands, rights-of-way, property, rights, easements, and interest acquired by the authority, the cost of demolishing or removing buildings or structures on the land so acquired, the cost of acquiring any lands to which those buildings or structures may be moved, the cost of all machinery and equipment, financing charges, interest prior to and during construction and for a period of not exceeding one (1) year after construction, the establishment of necessary funds and reserves, the cost of traffic estimates, engineering fees, legal fees, plans, specifications, surveys, estimates of cost and revenues, any other expenses or expenditures necessary or incidental to determining the feasibility or practicability of a turnpike project, administration expense, and any other expense, cost, or expenditure necessary or incidental to the construction of a turnpike project, the financing of the construction and the placing of the turnpike project into operation. Any obligation, expense, or expenditure incurred or made by the State Highway Commission, or any other state agency or department with the authority or prior or subsequent approval of the authority for matters pertaining to a turnpike project, including, without limitation, traffic surveys, borings, preparation of plans and specifications, engineering services, and any other expenses, costs, or expenditures of whatever nature shall be regarded as part of the costs of a turnpike project and may be reimbursed to the State Highway Commission or other agency or department of the state out of the proceeds of revenue bonds hereafter authorized or out of any other available funds of the authority;

(4) "Public roads" or "public highways" means all public highways and roads which at any time are part of the state highway system and all roads and highways which are part of the county road system of the State of Arkansas and all streets and roadways maintained by any municipality, improvement district, or political subdivision in the State of Arkansas;

(5) "Bonds," "turnpike revenue bonds," or "revenue bonds" means revenue bonds of the authority authorized under and issued pursuant to authorization conferred by this chapter;

(6) "Owner" means all individuals, partnerships, associations, corporations, or organizations having any title or interest in any property,

rights, easements, and interest authorized to be acquired by and under the authority conferred by this chapter;

(7) "Revenues" or "turnpike project revenues" embraces all tolls, rentals, turnpike gasoline tax revenues, gifts, grants, moneys, charges, and other funds and property of whatever nature coming into the possession of or under the control of the authority by virtue of this chapter, except the proceeds derived from the sale of revenue bonds issued under the provisions of this chapter;

(8) "Debt service" means the amounts necessary for paying principal, interest, trustee's, and paying agent's fees and the amounts necessary to establish and maintain debt service reserves as provided in the authorizing resolution or trust indenture identified hereinafter.

**History.** Acts 1973, No. 312, § 8; A.S.A. 1947, § 76-2409.

### 27-71-104. Ad valorem tax exemption.

(a) All turnpike projects and all the properties thereof are legislatively determined and declared to be public properties used exclusively for public purposes.

(b) The legislative intent is that turnpike projects and all properties thereof shall be exempt from ad valorem taxes under and pursuant to the provisions of the Arkansas Constitution, Article 16, Section 5.

**History.** Acts 1973, No. 312, § 18; A.S.A. 1947, § 76-2419.

### 27-71-105. No right of any character created until sale and delivery of bonds.

This chapter shall not create any right of any character, and no right of any character shall arise under or pursuant to it unless and until bonds issued under this chapter have been actually sold and delivered by the authority.

**History.** Acts 1973, No. 312, § 23; A.S.A. 1947, § 76-2424.

## SUBCHAPTER 2 — ARKANSAS TURNPIKE AUTHORITY

SECTION.
27-71-201. Creation.
27-71-202. Members.
27-71-203. Organization.
27-71-204. Secretary — Bond.
27-71-205. Meetings.
27-71-206. Powers — Generally.
27-71-207. Arrangements to study proposed turnpike projects.
27-71-208. Turnpike project prerequisites.
27-71-209. Powers and duties — Turnpike projects.
27-71-210. Audit of records and accounts of authority — Report.

**Effective Dates.** Acts 1973, No. 312, § 26: Mar. 13, 1973. Emergency clause provided: "It is hereby found and declared that the construction and operation of turnpike projects, as authorized by this Act, are required for the public health, safety and welfare because of the increase of commerce and vehicular travel essential to individual and State progress and prosperity. The moneys now available are insufficient to permit the construction of turnpike projects that can be constructed under the authority of this Act. The realization of the public benefits sought to be accomplished by this Act depends upon the prompt undertaking of the acts authorized hereby. Also, prompt action is necessary to coordinate planning and construction with similar projects in other states. Therefore, it is declared, for these reasons, that an emergency exists and this Act, being essential for the preservation of the public peace, health and safety, shall take effect and be in force from and after its passage and approval."

---

## 27-71-201. Creation.

There is created and established an authority to be known as the "Arkansas Turnpike Authority."

**History.** Acts 1973, No. 312, § 2; A.S.A. 1947, § 76-2402.

## 27-71-202. Members.

(a) The authority shall consist of five (5) members, made up of the five (5) individuals who are serving from time to time as the members of the State Highway Commission.

(b) The term of office of each member shall be the same as, and run concurrently with, each individual's tenure on the State Highway Commission.

**History.** Acts 1973, No. 312, §§ 3, 4; A.S.A. 1947, §§ 76-2403, 76-2405.

## 27-71-203. Organization.

The individual serving as chairman from time to time of the State Highway Commission shall be chairman of the authority, and the Director of Highways and Transportation shall be the secretary of the authority.

**History.** Acts 1973, No. 312, § 3; A.S.A. 1947, § 76-2403.

### 27-71-204. Secretary — Bond.

(a) The secretary shall be the authority's disbursing agent and executive officer.

(b) The secretary shall furnish bond to the State of Arkansas, with a corporate surety, in the penal sum of fifty thousand dollars ($50,000). This bond shall be conditioned that he will faithfully perform his powers, functions, and duties and properly handle all funds received and disbursed by him and account therefor.

(c) An additional disbursing agent's bond shall not be required of the secretary.

(d) The premium on the bond shall be a proper charge against funds of the authority.

**History.** Acts 1973, No. 312, § 7; A.S.A. 1947, § 76-2408.

**A.C.R.C. Notes.** The operation of subsections (b)-(d) of this section was suspended by adoption of a single blanket bond program for state officers and employees, effective January 1, 1986, pursuant to §§ 21-2-501 — 21-2-509. Subsections (b)-(d) of this section may again become effective upon cessation of coverage under that program. See § 21-2-503. But see also Acts 1985, No. 13 (§§ 21-2-601 — 21-2-613) which concerns blanket performance bond coverage for all public employees, including state officers and employees, and which repealed all conflicting laws as of January 1, 1986. Pursuant to § 21-2-603, the act does not apply if a single blanket bond program is adopted, but it is unclear what impact the act may have on preexisting bond requirements if coverage under the single blanket bond program ceases.

### 27-71-205. Meetings.

(a) Meetings of the authority shall be held on call by the chairman or by any three (3) or more members on advance notice to each member, at such place as may suit the authority's convenience.

(b) Meetings of the authority shall be open to the public, and records of the proceedings shall be kept.

(c) A quorum for the transaction of business at any meeting shall consist of not less than three (3) members.

(d) The affirmative vote of three (3) members shall be requisite for the authorizing or approving of any action or the passage or adoption of any motion or resolution.

**History.** Acts 1973, No. 312, § 6; A.S.A. 1947, § 76-2407.

### 27-71-206. Powers — Generally.

The authority is authorized and empowered to:

(1) Acquire by purchase or exercise of eminent domain sites and rights-of-way for and to construct, maintain, repair, and operate turnpike projects as defined in this chapter at such locations within the state as it shall determine in accordance with proper design and construction standards. Projects shall be constructed in accordance with applicable laws pertaining to competitive bidding, contracting, perfor-

mance, and payment bonds, and other matters applicable to similar highway construction by the State Highway Commission, which laws, as they may be amended or changed from time to time, are incorporated by reference;

(2) Apply for, receive, accept, and use any moneys and properties from agencies of the Government of the United States of America, from any state or other governmental agency, from any public or private corporation, agency, or organization of any nature, and from any individual or group of individuals;

(3) Invest and reinvest any of its moneys;

(4) Establish accounts in one (1) or more banks, and thereafter from time to time make deposits in and withdrawals from such accounts;

(5) Contract and be contracted with;

(6) Obtain the necessary funds for financing the objects specified in this section, including, without limitation, the proceeds of the sale of revenue bonds as in this chapter authorized;

(7) Purchase, lease, or rent and receive bequests or donations of, and sell or barter, any property bequeathed or donated to it not needed or which cannot be used in the form received;

(8) Fix, revise from time to time, and charge and collect tolls for transit over each turnpike project constructed by it;

(9) Establish rules and regulations for the use of each turnpike project;

(10) Employ consulting engineers, attorneys, accountants, construction and financial experts, superintendents, and other employees and agents that may be necessary in its judgment;

(11) Enter into and implement any agreements or compacts with the United States of America or any state or any department or agency of the United States or of any state, concerning operation, revenues or other matters pertaining to planning, financing, constructing, and operating projects leading from this state into another state or states;

(12) Enter into agreements with the State Highway Commission for the construction, maintenance, and operation of turnpike projects, and the authority and the commission are authorized to enter into and to implement any such agreements. In this connection, the authority is empowered to acquire and the commission is authorized to convey to the authority, for inclusion in a turnpike project, any portion of a public highway, including necessary lands and interests therein, constructed or under construction upon such terms and for consideration as the authority and the commission may agree. This subdivision shall constitute the sole authority required, notwithstanding the provisions of any other laws pertaining to the disposition of state property;

(13) Take such other action, not inconsistent with law, as may be necessary or desirable to carry out the powers conferred by this chapter and to carry out the intent and purposes of this chapter.

**History.** Acts 1973, No. 312, § 5; A.S.A. 1947, § 76-2406.

**27-71-207. Arrangements to study proposed turnpike projects.**

(a) The authority and the State Highway Commission are authorized to enter into arrangements or to enter into agreements, as may be determined by them to be necessary or desirable for the investigation and study of any proposed turnpike project or for the obtaining and use of outside engineering and traffic and other expert studies, all as may be necessary or desirable in connection with a proposed turnpike project, with all expenses in connection therewith which are paid by the State Highway Commission to be deemed part of the project costs.

(b) Upon the sale of bonds, all expenses incurred by the commission are to be reimbursed to the commission out of the proceeds of the bonds.

**History.** Acts 1973, No. 312, § 20; A.S.A. 1947, § 76-2421.

**27-71-208. Turnpike project prerequisites.**

No turnpike project shall be undertaken:

(1) Unless and until the turnpike project involved shall have been thoroughly studied with respect to traffic, engineering, costs, and financing; and

(2) Unless the authority makes, by resolution duly entered in the records of the authority, a determination based upon study that:

(A) Public funds for construction of a free, without toll, highway expressway are not sufficient;

(B) The construction of a toll highway expressway can be financed from the proceeds of revenue bonds and other available funds;

(C) Projected revenues, exclusive of turnpike gasoline tax revenues, to be derived from operation of the turnpike project involved as reflected by the study and determination of the authority required by this section will be sufficient, together with any other funds available for the purpose, to provide for operation and maintenance expenses and to cover not less than eighty percent (80%) of the projected debt service on revenue bonds to be issued, as reflected by the study and determination of the authority required by this section; and

(D) Projected revenues, including turnpike gasoline tax revenues, derived from operation of the turnpike project involved as reflected by the study and determination of the authority required by this section will be sufficient, together with any other funds available for the purpose, to provide for operation and maintenance expenses and to cover not less than one hundred percent (100%) of the projected debt service on revenue bonds to be issued, as reflected by the study and determination of the authority required by this section.

**History.** Acts 1973. No. 312. § 10: A.S.A. 1947. § 76-2410.

**27-71-209. Powers and duties — Turnpike projects.**

(a) In connection with the construction of any turnpike project, the authority is authorized to construct grade separations at intersections of any turnpike project with public highways and to change and adjust the lines and grades of public highways so as to accommodate the highway to the design of the grade separation. The cost of grade separations and any damages incurred in connecting and adjusting the lines and grades of public highways shall be ascertained and paid by the authority as part of the cost of the turnpike project involved.

(b) If the authority shall find it necessary to change the location of any portion of a public highway, it shall cause the highway to be reconstructed at such location as the authority shall deem most favorable and at least of substantially the same type construction and substantially as good a condition as the public highway was in immediately prior to the reconstruction. The cost of the reconstruction and any damages incurred in connection with the changing of the location of the public highway shall be ascertained and paid by the authority as a part of the project costs. However, the authority shall not change the location of any portion of a public highway subject to the exclusive jurisdiction of a county court without the prior approval of the county court involved.

(c) Any public highway affected by the construction of a turnpike project may be vacated or relocated by the authority in the manner now or hereafter provided by law for the vacation or relocation of public roads in the State of Arkansas, and any damages awarded on account thereof shall be paid by the authority as part of the project costs.

(d) The authority and its authorized agents and employees may enter upon any lands, waters, and premises in the State of Arkansas for the purpose of making surveys, soundings, drillings, and examinations as they may deem necessary or desirable for the purposes of carrying out the authority conferred by this chapter. These entries shall not be deemed trespasses, nor shall entries for those purposes be deemed entries under any condemnation proceedings which may then be pending. The authority shall make reimbursement to the owners for any actual damage resulting to any lands, waters, and premises as a result of these activities, and these reimbursements shall be part of the project costs.

(e) Whenever the authority shall determine that it is necessary for transmission facilities, such as tracks, pipes, mains, conduits, cables, wires, towers, poles, and other equipment and appliances of whatever nature existing or used in connection with public and private utilities, pipeline companies, or pipeline operators, which now are, or hereafter may be, located in, on, along, over, or under any turnpike project, to be

relocated in such turnpike project, or be removed from the turnpike project, the owner or operator of the transmission facilities shall relocate or remove them in accordance with the order of the authority. However, the cost and expenses of relocation or removal, including the cost of installing facilities in a new location or locations, and the cost of any lands, or any rights or interest in lands, and any other rights, acquired to accomplish relocation or removal, shall be ascertained and paid by the authority as part of the project costs.

(f) The State of Arkansas consents to the use by the authority of all lands and interest in lands owned by it, including lands lying under water which are deemed by the authority to be necessary for the construction or operation of any turnpike project.

(g) The power of eminent domain is expressly conferred upon the authority. In the event that any lands or interest therein, determined by the authority to be necessary for any turnpike project, cannot be acquired by negotiation, the authority is authorized to institute condemnation proceedings for the acquisition of the lands or the interest therein desired by the authority. Condemnation proceedings under the power of eminent domain may be exercised in the manner now provided for taking private property for rights-of-way for railroads as provided by §§ 18-15-1202 — 18-15-1207 and any amendments hereafter made thereto, or in the manner provided by §§ 18-15-301 — 18-15-307 and any amendments hereafter made thereto, or pursuant to any other statutory provisions now in force or hereafter enacted for the exercise of the power of eminent domain by the State of Arkansas or by any of its officers, agencies, or departments. Title to, and all interest in, lands acquired by the authority, by purchase or by condemnation, shall be taken in the name of the authority.

**History.** Acts 1973, No. 312, § 9; A.S.A. 1947, § 76-2411.

### 27-71-210. Audit of records and accounts of authority — Report.

The agency of the State of Arkansas authorized by law to audit the records and accounts of the various state agencies is authorized and directed to audit the records and accounts of the authority and to furnish a copy of the report of the audit to the authority, to the Legislative Council, and to the Governor.

**History.** Acts 1973, No. 312, § 21; A.S.A. 1947, § 76-2422.

## Subchapter 3 — Turnpike Project Revenues

SECTION.
27-71-301. Deposit of revenues.
27-71-302. Use of revenues.
27-71-303. Tolls.
27-71-304. Contracts with retail establishments — Bids.
27-71-305. Gasoline tax deemed part of project revenues.
27-71-306. Determination of revenue from gasoline tax.
27-71-307. Resolution showing gasoline tax revenues — Payment to authority.
27-71-308. Disposition of revenue.

---

**Cross References.** Arkansas Highway Revenue Distribution Law, § 27-70-201 et seq.

Motor Fuel Tax Law, § 26-55-201 et seq.

Special Motor Fuel Tax Law, § 26-56-101 et seq.

**Effective Dates.** Acts 1973, No. 312, § 26: Mar. 13, 1973. Emergency clause provided: "It is hereby found and declared that the construction and operation of turnpike projects, as authorized by this Act, are required for the public health, safety and welfare because of the increase of commerce and vehicular travel essential to individual and State progress and prosperity. The moneys now available are insufficient to permit the construction of turnpike projects that can be constructed under the authority of this Act. The realization of the public benefits sought to be accomplished by this Act depends upon the prompt undertaking of the acts authorized hereby. Also, prompt action is necessary to coordinate planning and construction with similar projects in other states. Therefore, it is declared, for these reasons, that an emergency exists and this Act, being essential for the preservation of the public peace, health and safety, shall take effect and be in force from and after its passage and approval."

---

### 27-71-301. Deposit of revenues.

The revenues derived from the turnpike project shall be deposited, as and when received, into a special account or accounts of the Arkansas Turnpike Authority in such depository banks or trust companies as may from time to time be designated by the authority, with the accounts to be appropriately designated to indicate the particular turnpike project involved.

**History.** Acts 1973, No. 312, § 11; A.S.A. 1947, § 76-2412.

### 27-71-302. Use of revenues.

The turnpike project revenues are declared to be cash funds restricted in their use and dedicated and to be used solely as authorized in this chapter. The revenues shall be used:

(1) To pay the reasonable expenses of maintenance, repair, and operation of the turnpike project or projects involved;

(2) To pay as due the debt service on all revenue bonds to which revenues of the project or projects are pledged, including the original

issue or issues, bonds issued for reconstruction and extension, and refunding bonds, as in this chapter authorized;

(3) For the establishing or, once established, for maintaining any reserves as provided in the authorizing resolution or the trust indenture;

(4) For the redemption of bonds prior to maturity, if provision is made for redemption, all as shall be specified in detail in the trust indenture, and all indentures supplemental thereto, securing the bonds.

**History.** Acts 1973, No. 312, § 11; A.S.A. 1947, § 76-2412.

### 27-71-303. Tolls.

(a) The authority is authorized to fix, revise, charge, and collect tolls for the use of each turnpike project and the different parts or sections thereof and to contract with any person, partnership, association, corporation, or organization desiring the use of any part thereof, including the right-of-way adjoining the paved portion, for placing thereon telephone, telegraph, electric light or power lines, motor fuel service stations, garages, restaurants, and other facilities, or for any other purpose, and to fix the terms, conditions, rents, and rates of charges for use. However, public utilities, rural cooperatives, political subdivisions, and pipeline companies may construct and maintain crossings of turnpike projects with their facilities, without charge, if the facilities are constructed and maintained in compliance with reasonable requirements of public safety and all costs of restoring the project to as good a condition as it was before being disturbed are paid by the owner of the facilities.

(b) The tolls shall not be subject to supervision or regulation by any other commission, board, bureau, or agency of the State of Arkansas.

**History.** Acts 1973, No. 312, § 11; A.S.A. 1947, § 76-2412.

### 27-71-304. Contracts with retail establishments — Bids.

(a) All contracts made by the authority for establishments selling at retail, including, without limitation, motor fuel service stations, garages, and restaurants, shall be made separately for each establishment and shall be made on the basis of the best responsible bid received after advertisement for sealed bids for each separate establishment published not less than once a week for two (2) consecutive weeks with the first publication at least fifteen (15) days prior to the bid date in a newspaper of general circulation throughout the State of Arkansas.

(b) The notice shall state the general character of the establishment involved, where plans and specifications may be examined if they are

available in connection with the bidding, and the time and place for receiving bids.

(c) Each bid shall specify full information concerning the identity of the bidder and its financial ability, to the extent requested by the authority, to perform if awarded the contract.

(d) The authority may insert other provisions in each notice as it deems appropriate and may reject any and all bids.

**History.** Acts 1973, No. 312, § 11; A.S.A. 1947, § 76-2412.

### 27-71-305. Gasoline tax deemed part of project revenues.

(a) Turnpike gasoline tax revenues shall, for all purposes of this chapter, be deemed part of the turnpike project revenues.

(b) It is found and declared by the General Assembly that:

(1) Turnpike gasoline tax revenues are directly related to the construction and operation of turnpike projects and are to be considered as part of the revenues derived from the turnpike project involved rather than taxes as that term is understood for cash funds purposes; and

(2) The procedure set forth in this subchapter is a reasonable and valid method for the determination of turnpike gasoline tax revenues attributable to a turnpike project.

(c) Therefore, upon full and thorough investigation and evaluation of the pertinent facts, it is found and declared that turnpike project revenues as determined by the procedure set forth in this subchapter are, and shall be conclusively treated as, revenues derived from the particular turnpike project involved.

**History.** Acts 1973, No. 312, § 11; A.S.A. 1947, § 76-2412.

### 27-71-306. Determination of revenue from gasoline tax.

(a) As part of the study and determination of the authority required by § 27-71-208, the authority shall determine, according to the formula hereinafter set forth, the projected revenues to be derived from the motor fuel taxes, which are the taxes levied and collected under the Motor Fuel Tax Law and the Special Motor Fuels Tax Law, or any similar law or laws hereafter enacted, commonly referred to as the gasoline tax, to be paid on all fuels to be consumed annually on each turnpike project.

(b) To determine turnpike gasoline tax revenues, the authority shall divide the total miles projected to be traveled on each turnpike project by Class A vehicles, which include automobiles, except buses, with a capacity of fewer than eight (8) passengers; Class B vehicles, which include truck-type vehicles, except buses, with a factory rating and gross loaded weight of twenty-two thousand five hundred pounds (22,500 lbs.) or less; Class C vehicles, which include all vehicles, except buses, with a factory rating in excess of twenty-two thousand five

hundred pounds (22,500 lbs.) or whose gross loaded weight exceeds twenty-two thousand, five hundred pounds (22,500 lbs.); and Class D vehicles, which include buses rated and licensed as such, by the average number of miles per gallon of motor fuel consumed by each of those classes of vehicles. To determine the total miles projected to be traveled, the authority shall initially take into consideration the feasibility study and thereafter take into consideration actual usage plus any other known or reasonably anticipated factors affecting or reasonably expected to affect usage. The following consumption rates shall be used:

| | |
|---|---|
| Class A Vehicles | 10 miles per gallon |
| Class B Vehicles | 6 miles per gallon |
| Class C Vehicles | 4 miles per gallon |
| Class D Vehicles | 5 miles per gallon |

(c) The amount so determined is designated turnpike gasoline tax revenues.

(d) Turnpike gasoline tax revenues shall be determined separately for each turnpike project.

(e) The authority may make a new determination at any time, but not more than once in any twelve-month period.

**History.** Acts 1973, No. 312, § 11; A.S.A. 1947, § 76-2412.

### 27-71-307. Resolution showing gasoline tax revenues — Payment to authority.

(a) The determination by the authority of turnpike gasoline tax revenues, as projected, shall be set forth in a resolution of the authority, a certified copy of which shall be filed with the Director of the Department of Finance and Administration.

(b) Upon receipt of the resolution, the Director of the Department of Finance and Administration shall pay over to the authority on or before the tenth day of each month, from general gasoline tax receipts, an amount equal to one-twelfth (1/12) of the annual amount of turnpike gasoline tax revenues, as set forth in such resolution, until there is filed with the Director of the Department of Finance and Administration a certified copy of a resolution setting forth a new determination of annual turnpike project revenues.

(c) After each new resolution is filed, the director shall pay over to the authority, in the manner set forth above, monthly, one-twelfth (1/12) of the newly determined annual amount.

**History.** Acts 1973, No. 312, § 11; A.S.A. 1947, § 76-2412.

**27-71-308. Disposition of revenue.**

(a) Turnpike gasoline tax revenues are declared to be cash funds restricted in their use and dedicated and to be used solely as authorized in this chapter.

(b) Notwithstanding the provisions of the Arkansas Highway Revenue Distribution Law or any other law concerning or pertaining to gasoline taxes, the turnpike gasoline tax revenues, subject to the subsequent provisions hereof, shall not be paid into the State Treasury and shall not become part of highway revenues. They shall be paid directly to the authority each month and shall be and become part of the revenues for the turnpike project for which applicable, as in this chapter set forth.

(c) The amount of the motor fuel taxes paid on fuels consumed on each turnpike project in excess of turnpike gasoline tax revenues shall be and remain highway revenues and be handled as provided in the Arkansas Highway Revenue Distribution Law or other applicable law at the time controlling highway revenues.

(d) So long as any bonds are outstanding hereunder, if any changes are made by the General Assembly in motor fuel taxes or in the distribution of highway revenues, they must be such that substantially the same amount of turnpike gasoline tax revenues will be received by the authority as would have been received had there been no changes.

(e) Anything herein to the contrary notwithstanding, the authority shall adopt a resolution setting forth the facts recited in subdivisions (1) and (2) of this subsection and shall file a certified copy of the resolution with the trustee under the trust indenture and a certified copy with the Director of the Department of Finance and Administration, if, at the end of any fiscal year, revenues of any turnpike project exclusive of turnpike gasoline tax revenues allocated to that turnpike project for the fiscal year just ended were sufficient in amount:

(1) To cover expenses of maintenance, repair, and operation of that turnpike project for the next fiscal year as estimated by the authority;

(2) To pay the debt service on outstanding revenue bonds to which the revenues of that turnpike project are pledged and to comply with any other provisions of the trust indenture pertaining to the maintenance of revenues at specified levels.

(f) Upon receipt of the resolution, the Director of the Department of Finance and Administration shall not pay turnpike gasoline tax revenues to the authority for the remainder of the fiscal year in which the resolution is received but shall handle the turnpike gasoline tax revenues as other highway revenues.

(g) Each resolution shall be applicable for one (1) fiscal year only. Beginning with the next succeeding fiscal year, the provisions of this section shall automatically become applicable and remain so until the facts warrant another resolution and the resolution is adopted and filed as aforesaid.

RECEIVED
MAR 19 1991
CHIEF ENGINEER'S OFFICE
ARKANSAS STATE HIGHWAY AND
TRANSPORTATION DEPARTMENT

ACT 547 1991

A Bill

SENATE BILL 281

State of Arkansas
78th General Assembly
Regular Session, 1991
By: Senator Malone

**For An Act To Be Entitled**

"AN ACT TO AUTHORIZE THE ARKANSAS STATE HIGHWAY COMMISSION, IN ITS DISCRETION, TO TRANSFER TO THE ARKANSAS TURNPIKE AUTHORITY, AS ESTABLISHED BY ARKANSAS CODE §§27-71-201, ET SEQ., ANY FEDERAL-AID HIGHWAY FUNDS APPORTIONED OR ALLOCATED TO THE STATE OF ARKANSAS BY THE UNITED STATES SECRETARY OF TRANSPORTATION OR THE FEDERAL HIGHWAY ADMINISTRATION WHICH FUNDS ARE AUTHORIZED, OR MAY BE AUTHORIZED IN THE FUTURE, BY THE UNITED STATES CONGRESS TO BE UTILIZED IN ASSISTING IN THE CONSTRUCTION OF OR FOR THE PURPOSES OF ASSISTING IN THE PAYING OF THE DEBT SERVICE ON REVENUE BONDS ISSUED FOR THE CONSTRUCTION OF ANY TURNPIKE PROJECT OR PROJECTS IN THIS STATE, WHICH PROJECT OR PROJECTS MAY BE UNDERTAKEN BY THE ARKANSAS TURNPIKE AUTHORITY IN ACCORDANCE WITH ARKANSAS CODE §§27-71-101, ET SEQ.; TO AMEND ARKANSAS CODE §27-71-103(7) TO INCLUDE IN THE DEFINITION OF 'REVENUES' OR 'TURNPIKE PROJECT REVENUES', FEDERAL-AID HIGHWAY FUNDS, THUS ALLOWING THE USE OF SUCH FEDERAL-AID HIGHWAY FUNDS BY THE ARKANSAS TURNPIKE AUTHORITY FOR ANY TURNPIKE PROJECT OR PROJECTS UNDERTAKEN IN ACCORDANCE WITH ARKANSAS CODE §§27-71-101, ET SEQ.; AND FOR OTHER PURPOSES."

BE IT ENACTED BY THE GENERAL ASSEMBLY OF THE STATE OF ARKANSAS:

SECTION 1. Notwithstanding any provision of law to the contrary, the Arkansas State Highway Commission is hereby authorized to transfer, in its discretion, to the Arkansas Turnpike Authority, as established by

vjf235

of turnpike projects, as authorized by prior legislative acts, are required for the public health, safety and welfare because of the increase of commerce and vehicular travel essential to individual and state progress and prosperity. The monies now available are insufficient to permit the construction of turnpike projects that can be constructed under the authority of those acts, however, it is anticipated that the United State Congress will in the near future authorize the use of federal-aid highway funds apportioned or allocated to this state for assisting in the construction of or assisting in the paying of the debt service on revenue bonds issued for the construction of turnpike projects. Prompt action is necessary to insure that, should such authorization be enacted by the United States Congress, such federal-aid funds may be utilized for such turnpike project purposes. Therefore, it is declared, for these reasons, that an emergency exists and this act being essential for the preservation of the public peace, health and safety, shall take effect and be in full force on and after its passage and approval.

APPROVED Bob Riley

ACT 192 1989

A Bill

SENATE BILL 349

For An Act To Be Entitled

"AN ACT TO AUTHORIZE THE ARKANSAS HIGHWAY COMMISSION TO ESTABLISH TURNPIKE PROJECTS AND TO COLLECT TOLLS; AND FOR OTHER PURPOSES."

BE IT ENACTED BY THE GENERAL ASSEMBLY OF THE STATE OF ARKANSAS:

SECTION 1. As used in this chapter, unless the context otherwise requires:

(1) "Commission" means the Arkansas Highway Commission;

(2) "Project" or "turnpike project" means any express highway constructed under the provisions of this chapter by the Commission including, without limitation, lands, rights-of-way, bridges, tunnels, overpasses, underpasses, interchanges, entrance plazas, approaches, toll houses, service stations, administration buildings, storage buildings, other buildings, and facilities which the authority may deem necessary or desirable for the operation of a turnpike project, together with all property, rights, easements, rights-of-way, and interest that may be acquired by the Commission for or in connection with the construction or operation of a turnpike project. Each turnpike project shall be separately designated by appropriate name or number and may be constructed, reconstructed, or extended in sections and stages as the authority may from time to time determine.

SECTION 2. (a) The Commission shall have the authority to undertake turnpike projects.

(b) No turnpike project shall be undertaken:

(1) Unless and until the turnpike project involved shall have been thoroughly studied with respect to traffic, engineering, costs, and financing; and

(2) Unless the Commission makes, by resolution duly entered in the

President of the Senate

mih243

SECTION 5. All revenue derived from this Act shall be classified as "special revenues" and shall be deposited in the State Treasury, and the net amount thereof shall be transferred by the State Treasurer on the last business day of each month to the Arkansas State Highway and Transportation Department, there to be used for the maintenance, operation and improvement required by the Arkansas State Highway and Transportation Department in carrying out its functions, powers, and duties.

SECTION 6. All provisions of this Act of a general and permanent nature are amendatory to the Arkansas Code of 1987 Annotated and the Arkansas Code Revision Commission shall incorporate the same in the Code.

President of the Senate

APPROVED BY Bill Clinton
GOVERNOR

Statement of
F.S. GARRISON
APPEARING BEFORE THE
SURFACE TRANSPORTATION SUBCOMMITTEE
OF THE
PUBLIC WORKS AND TRANSPORTATION COMMITTEE
UNITED STATES HOUSE OF REPRESENTATIVES
IN SESSION AT FORT SMITH, ARKANSAS
ON APRIL 22, 1991

My name is F.S. Garrison. I am Chairman, President and Chief Executive Officer of Arkansas Freightways Corporation (AFC), a publicly held company headquartered at Harrison, Arkansas. AFC is in the for-hire business of transporting less than truckload shipments moving in interstate commerce serving all points in the states of Alabama, Arkansas, Kansas, Louisiana, Mississippi, Missouri, Oklahoma, Tennessee and Texas, plus the metropolitan Atlanta and Chicago areas, and moving in intrastate commerce serving all points in Arkansas, Kansas and Louisiana.

AFC was founded in 1982, following deregulation of the for-hire interstate trucking industry, and presently has over 2,700 associates operating over 5,000 pieces of revenue producing highway equipment from 112 terminal locations in its eleven-state service area. The company experienced revenues of $143 Million during 1990. I have 33 years of involvement in the trucking business in many different capacities including driving and handling freight as well as management.

First, some comments as a citizen of the Third Congressional District of Arkansas, and I am both proud and pleased to be a constituent of Congressman Hammerschmidt, for he has served extra-ordinarily well. I am very hopeful that the means may be found

for significant improvements to the major highways in the Third District, among them U.S. Highway 65, the major north-south route linking central and north-central Arkansas, U.S. Highway 71, the major north-south route between the southwestern and northwestern quadrants of the state, and U.S. Highway 412, the major east-west route across north Arkansas. These are the economic lifelines of the Third District. I think I am qualified to testify as to their importance to the citizens of the Third District, which district is leading the way for economic development of the State of Arkansas.

My remaining comments will speak primarily to the Department of Transportation's proposed 1991 Surface Transportation Assistance Act, and I will try to be brief. Obviously this legislation makes the effort to provide the needed flexibility at state and local levels while providing uniformity in a national network of highways and bridges, at the same time enforcing accountability for the expenditure of taxpayer funds. I applaud this effort.

* National Highway Program - I generally support the proposed system and its program features, except I oppose the application of highway user taxes to toll road projects. Somehow I cannot get it through my head that this is fair to either the users or non-users of toll roads.

* Urban/Rural Program - I generally support the proposed program, but I am opposed to the application of highway user taxes to mass transit, so I urge that this be held to a minimum.

* Bridge Program - I support the proposed special bridge program. Our bridges are probably the most glaring deficiency of our present highway system.

* Bonus Set-Aside for Highway Safety - I support the emphasis on safety including that directed at heavy truck safety.

* Research and Technology - I support this proposal. A pavement performance data base should save the taxpayers money in extending the life of capital projects and in minimizing maintenance costs. The University Transportation Centers should be continued, and the University of Arkansas should be chosen for the location of one of the proposed additional three centers. Historically the State of Arkansas has not shared proportionately in Federal research monies. The Oren Harris Chair of Transportation at the University of Arkansas affords special capabilities in this area.

* Motor Carriers - I support all of the proposals under this program. We have such a fine system of government for which to be thankful, but only in America would we put up with fifty different ways of collecting fuel taxes and vehicle registration fees. What a burden to commerce, productivity, and this nation's ability to compete with other nations in our present (and even more so in the future) global economy! While some progress has been made in this respect it has been ridiculously slow. If the American consumer knew the price he paid for this archaic way of doing business he would most certainly demand action. It is obvious uniform Federal standards are needed.

Likewise the Federal government should preempt the states' rights to regulate intrastate commerce. The benefits to this nation's consumers, its workers, and its very ability to compete internationally have been clearly demonstrated through deregulation of the interstate for-hire motor carrier industry. These benefits

should be further extended as proposed in this legislation.

* Funding Provisions - With the addition of the recent nickel fuel tax at the Federal level, Federal funding should be adequate for the foreseeable future, particularly if trust funds were required to be spent on a current basis. Failure to do so breaks faith with the American taxpayer. Furthermore, it is not smart to withhold money and defer maintenance on what is basically a fine network of roads and bridges. Anybody knows a stitch in time saves nine. Finally, the recent action involving the diversion of user taxes and fees to offset the Federal Government's lack of discipline, when it comes to expenditures, sets a dangerous precedent. For all it means, the word "Trust" should be eliminated from the phrase, "Trust Fund".

I don't expect you to agree with everything I say, but do want you to know that I appreciate your coming to Arkansas to hear my views, and I make myself available should you want to question me or just "get even".

STATEMENT BEFORE

THE SUBCOMMITTEE ON SURFACE TRANSPORTATION
OF THE
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
U.S. HOUSE OF REPRESENTATIVES

RELATING TO

# REAUTHORIZATION OF THE SURFACE TRANSPORTATION PROGRAM

BY

**RON HARROD**

CHAIRMAN, ARKANSAS HIGHWAY COMMISSION
ARKANSAS STATE HIGHWAY AND TRANSPORTATION DEPARTMENT

APRIL 22, 1991

# INTRODUCTION

## HIGHWAY SYSTEM NEEDS

MR. CHAIRMAN AND MEMBERS OF THE COMMITTEE, I AM PLEASED TO BE HERE TODAY TO DISCUSS WITH YOU THE HIGHWAY INFRASTRUCTURE NEEDS WE ARE NOW FACING IN ARKANSAS. ON SEPTEMBER 8, 1990, IN SPRINGDALE, ARKANSAS, THE ARKANSAS HIGHWAY AND TRANSPORTATION DEPARTMENT PERSENTED A GENERAL OVERVIEW OF THE STATE'S HIGHWAY NEEDS AT THE INFRASTRUCTURE PUBLIC HEARING CONDUCTED BY THE CONGRESSIONAL HOUSE PUBLIC WORKS AND SURFACE TRANSPORATION COMMITTEE. TODAY WE WILL BE MORE SPECIFIC IN ADDRESSING THESE NEEDS SO THAT YOU CAN GET A PICTURE OF THE STATUS OF OUR HIGHWAY SYSTEM AND A FEEL FOR FUTURE NEEDS IN OUR STATE.

## REAUTHORIZATION ISSUES

WE WILL ALSO ADDRESS THE FORTHCOMING REAUTHORIZATION OF THE SURFACE TRANSPORTATION PROGRAM. THERE ARE SOME MAJOR ISSUES IN THE ADMINISTRATION'S PROPOSAL AS PRESENTED THAT CAN HAVE A TREMENDOUS IMPACT ON THE FUTURE OF THE HIGHWAY SYSTEM IN ARKANSAS. IT IS IMPERATIVE THAT CONGRESS MAKE CHANGES TO EXISTING FEDERAL LEGISLATION WHICH WILL ALLOW ARKANSAS AND THE REST OF THE NATION TO "GET ON" WITH PROVIDING ITS CITIZENS WITH THE TYPE OF SYSTEM NEEDED AND DESIRED. A TRANSPORTATION POLICY AND PROGRAM THAT WILL MEET THE CHANGING NEEDS AS WE BEGIN A NEW CENTURY IS VITALLY NEEDED.

## GENERAL NEEDS STUDY RESULTS

ARKANSAS' INFRASTRUCTURE IS SHOWING SIGNS THAT THE EXISTING SYSTEM IS BEGINNING TO WEAR OUT AT AN ACCELERATED RATE. THIS HAS BEEN CONFIRMED BY AN INDEPTH COMPREHENSIVE NEEDS STUDY CONDUCTED BY OUR DEPARTMENT.

THE RESULTS WERE ALARMING. THE STUDY POINTED OUT THAT THE EXISTING GAP BETWEEN HIGHWAY REVENUES AND NEEDED HIGHWAY IMPROVEMENTS MUST BE ADDRESSED IMMEDIATELY. WHILE THE DEPARTMENT HAS BEEN ABLE TO MAKE SOME PROGRESS ON UPGRADING AND IMPROVING MAJOR TRAVEL CORRIDORS THROUGHOUT THE STATE, THE STUDY INDICATED THAT THE HIGHWAY COMMISSION WOULD BE FORCED TO CURTAIL THESE TYPE IMPROVEMENTS AND INSTEAD SPEND ALL AVAILABLE REVENUE TO PRESERVE THE EXISTING HIGHWAY SYSTEM.

THIS INFORMATION WAS PRESENTED TO THE ARKANSAS LEGISLATURE DURING THE RECENTLY COMPLETED SESSION OF THE STATE GENERAL ASSEMBLY. IN ORDER TO PRESERVE THE EXISTING INVESTMENT IN THE STATE HIGHWAY SYSTEM AND TO MAKE PROGRESS TOWARD COMPLETION OF MAJOR CORRIDOR IMPROVEMENTS, ADDITIONAL FUNDING WAS APPROVED TO HELP FINANCE A $2.5 BILLION PROGRAM. COMPLETION OF THESE IMPROVEMENTS IS ANTICIPATED TO TAKE APPROXIMATELY 15 YEARS.

IT IS IMPERATIVE TO NOTE THAT THIS PROGRAM IS DEPENDENT UPON SUBSTANTIAL AMOUNTS OF FEDERAL ASSISTANCE. ADDITIONALLY, IT DEALS ONLY WITH THE MOST CRITICAL AND PRESSING PROBLEMS. IN ORDER FOR ARKANSAS TO MAKE SUBSTANTIAL PROGRESS IN MEETING ITS TRANSPORTATION NEEDS, A NEW FINANCIALLY RESPONSIVE FEDERAL SURFACE TRANSPORTATION PROGRAM IS ESSENTIAL.

THE ARKANSAS STATE HIGHWAY COMMISSION IS RESPONSIBLE FOR 16,171 MILES OF STATE HIGHWAYS, THE 16TH LARGEST STATE-OPERATED SYSTEM IN THE NATION. CURRENTLY 46% OF THE SYSTEM IS IN POOR CONDITION AND NEEDS RECONSTRUCTION. ANOTHER 34% IS IN FAIR CONDITION, NEEDING MINOR IMPROVEMENTS SUCH AS RESURFACING TO PREVENT FURTHER DETERIORATION.

SINCE ARKANSAS WAS ONE OF THE FIRST STATES TO COMPLETE ITS INTERSTATE PROGRAM, OUR EXISTING INTERSTATE HIGHWAYS ARE BEGINNING TO DETERIORATE AT A RAPID RATE. WE MUST NOW GIVE THIS SYSTEM OUR IMMEDIATE ATTENTION BECAUSE IT IS THE BACKBONE OF TRANSPORTATION IN ARKANSAS.

AT THE SAME TIME, WE MUST PROVIDE NEEDED IMPROVEMENTS FOR APPROXIMATELY 1,100 MILES OF URBAN AND RURAL HIGHWAYS SUFFERING FROM CAPACITY PROBLEMS DUE TO LARGE TRAFFIC VOLUMES. THESE HIGHWAYS MUST BE WIDENED AND RECONSTRUCTED TO PROVIDE AN ADEQUATE LEVEL OF SERVICE. IN ORDER TO PROLONG THE LIFE OF OTHER STATE HIGHWAYS AND REDUCE MAINTENANCE COSTS, APPROXIMATELY 8,000 MILES NEED TO BE RECONSTRUCTED OR RESURFACED WITHIN THE NEXT 10 YEARS.

## ROADWAY STATUS

OVER 90% OF THE STATE HIGHWAY SYSTEM IS TWO LANES, WITH 58% OF THESE HAVING LANE WIDTHS OF 10 FEET OR LESS. THESE CHARACTERISTICS ALONE TYPIFY AN OBSOLETE SYSTEM THAT IS EXPERIENCING INCREASING CAPACITY AND SAFETY PROBLEMS. THESE PROBLEMS WILL ONLY ESCALATE AS TRAFFIC VOLUMES INCREASE AND, MORE SIGNIFICANTLY, THE NUMER OF TRUCKS INCREASE.

## BRIDGE STATUS

ANOTHER MAJOR PROBLEM IN ARKANSAS IS THE CONDITION OF OUR BRIDGES. WE CURRENTLY HAVE 6,722 BRIDGES ON THE STATE HIGHWAY SYSTEM, OF WHICH 1,700 BRIDGES, OR 25%, ARE EITHER STRUCTURALLY DEFICIENT OR FUNCTIONALLY OBSOLETE. UNDER THE CURRENT FUNDING LEVEL FOR BRIDGE REPLACEMENT FUNDS IT WILL TAKE SEVERAL YEARS TO REHABILITATE OR REPLACE THE 427 BRIDGES ON OUR HIGHWAY SYSTEM THAT ARE NOW POSTED BECAUSE THEY ARE NOT CAPABLE OF CARRYING THE 80,000 POUND LEGAL LOAD LIMIT.

## EXPANDED FOUR-LANE SYSTEM NEEDS

IN ADDITION TO THE NEEDS OF OUR EXISTING ROADWAYS AND BRIDGES, THE STATE MUST PROVIDE AN EXPANDED FOUR-LANE SYSTEM IF IT IS TO SURVIVE ECONOMICALLY. THE LACK OF AN ADEQUATE STATEWIDE FOUR-LANE NETWORK FOR MOBILITY IS AN IMPEDIMENT TO THE GROWTH AND EXPANSION OF EXISTING INDUSTRIES AND TO ATTRACTING NEW INDUSTRIES TO THE STATE. TOURISM, WHICH IS A MAJOR INDUSTRY IN ARKANSAS, IS ALSO DEPENDENT UPON AN ADEQUATE LEVEL OF FOUR-LANE SERVICE.

AN EXCELLENT CASE FOR EXPANDING OUR FOUR-LANE SYSTEMS WAS MADE BY INDUSTRY LEADERS ON SEPTEMBER 8, 1990, AT THE CONGRESSIONAL HOUSE PUBLIC WORKS INFRASTRUCTURE SUBCOMMITTEE HEARING IN SPRINGDALE, ARKANSAS. THE MAIN EMPHASIS AT THE HEARING WAS THAT FOUR-LANE ROADS PROVIDE ECONOMIC VITALITY AND ALLOW THE PRIVATE SECTOR TO COMPETE MORE EFFECTIVELY IN TODAY'S MARKET PLACE.

THE PROGRAM THAT WAS RECENTLY APPROVED BY THE STATE GENERAL ASSEMBLY WILL PROVIDE SIGNIFICANT ASSISTANCE. AS POINTED OUT PREVIOUSLY, HOWEVER, THIS PROGRAM IS HEAVILY DEPENDENT UPON A RESPONSIVE FEDERAL-AID PROGRAM TO HELP MEET THE STATE'S ARTERIAL NEEDS.

## REVENUE STATUS

THE DEPARTMENT'S NEEDS STUDY INDICATES OVER $7 BILLION IS NEEDED OVER THE NEXT 10 YEARS TO MEET OUR STATE'S ROADWAY AND BRIDGE IMPROVEMENT NEEDS AND AT THE SAME TIME PROVIDE ALL ESSENTIAL FOUR-LANE CORRIDOR IMPROVEMENTS. WITH THE RECENTLY APPROVED LEGISLATIVE PROGRAM AND CONTINUATION OF FEDERAL AID REVENUES AT EXISTING FUNDING LEVELS, APPROXIMATELY $2.5 BILLION OF THIS AMOUNT CAN NOW BE MET.

THE BOTTOM LINE IS THAT ADDITIONAL FEDERAL FUNDS CAN BE UTILIZED TO PROVIDE A MORE ADEQUATE HIGHWAY PROGRAM AND FOR ARKANSAS TO COMPETE AND DEVELOP. THIS CAN BE ACCOMPLISHED BY CHANGING EXISTING FUNDING POLICIES AS WE MOVE TOWARD NEW FEDERAL LEGISLATION.

## NEW STATE PROGRAM WILL HELP

PRESENTLY, THE HIGHWAY COMMISSION IS DEVELOPING A NEW CONSTRUCTION PROGRAM TO IMPLEMENT THE IMPROVEMENTS FUNDED BY THE 1991 SESSION OF THE ARKANSAS GENERAL ASSEMBLY. THIS NEW PROGRAM WILL SATISFY MANY OF OUR NEEDS, BUT WILL NOT COMPLETE MANY OF THE ESSENTIAL CORRIDOR IMPROVEMENTS NECESSARY FOR MOBILITY AND MOVEMENT OF GOODS.

AS STATED PREVIOUSLY, THIS PROGRAM IS DEPENDENT UPON A REAUTHORIZATION OF THE FEDERAL SURFACE TRANSPORTATION ACT. WE WOULD LIKE TO SEE AN ACT THAT WILL INCREASE THE AMOUNTS OF FEDERAL FUNDING AVAILABLE FOR ARKANSAS' NEEDS.

## NEW FEDERAL TRANSPORTATION POLICY ISSUES

I WOULD NOW LIKE TO ADDRESS THE ISSUE OF A NEW SURFACE TRANSPORTATION PROGRAM AND DISCUSS SOME ELEMENTS THAT WOULD RESULT IN A FINANCIALLY SOUND TRANSPORTATION PROGRAM. I WILL TRY TO BE VERY SPECIFIC ON SEVERAL MAJOR ISSUES REGARDING WHAT ARKANSAS NEEDS IN FUTURE FEDERAL TRANSPORTATION LEGISLATION.

### Matching Ratios

FIRST OF ALL, THE ADMINISTRATION'S POLICY CALLS FOR STATE AND LOCAL GOVERNMENTS AND THE PRIVATE SECTOR TO SHOULDER THE BULK OF THE COST TO REBUILD AND EXPAND THE SYSTEM. THIS THEME IS A MAJOR FOCAL POINT IN THE SECRETARY OF TRANSPORTATION'S PROPOSED POLICY WHICH ADDRESSES THE NEED FOR A CHANGING FEDERAL, STATE, AND LOCAL ROLE. IT IS AGREED THAT THE FEDERAL GOVERNMENT SHOULD CONCENTRATE ITS EFFORTS ON MAJOR CORRIDORS, OR AS NOW BEING PROPOSED, THE "NATIONAL HIGHWAY SYSTEM," AND SHOULD PROVIDE FLEXIBILITY WITH LESS RIGID REQUIREMENTS. HOWEVER, WE DO NOT AGREE THAT THE FEDERAL GOVERNMENT SHOULD FORCE THE STATE TO INCREASE THEIR INVESTMENT IN TRANSPORTATION THROUGH INCREASING THEIR SHARE, OR "MATCH," IN THE INDIVIDUAL PROJECT COST.

WE BELIEVE THE CHANGE IN THE FUNDING RATIO FOR THE URBAN/RURAL PROGRAM TO 60% FEDERAL-40% NON-FEDERAL IS A SERIOUS MISTAKE. THIS INCREASED LEVEL OF PARTICIPATION BY STATE AND LOCAL GOVERNMENTS WILL ADVERSELY IMPACT SUCH PROGRAMS AS HAZARD ELIMINATION, RAIL/HIGHWAY CROSSING, TRAFFIC SIGNALIZATION, PAVEMENT MARKING, RAILROAD OVERPASSES, AND OTHERS WHERE THE FUNDS ARE SHARED WITH LOCAL GOVERNMENTAL AGENCIES. IN MANY INSTANCES, NEITHER THE STATE NOR LOCAL GOVERNMENTS WILL HAVE ADEQUATE RESOURCES AVAILABLE TO PROVIDE THIS HIGHER LEVEL OF MATCHING FUNDS. WE BELIEVE THAT THIS INCREASED FUNDING LEVEL BY THE STATE AND LOCAL GOVERNMENTS WILL DIRECTLY LEAD TO A DECREASE IN THE NUMBER OF SAFETY PROJECTS INITIATED.

THIS REDUCED FEDERAL FUNDING RATIO APPEARS TO BE A GOAL OF THE LARGE METROPOLITAN TRANSIT AGENCIES WHICH BELIEVE THAT THIS INCREASED LOCAL MATCHING REQUIREMENT WILL END "MODAL BIASES" AND MAKE ADDITIONAL FUNDS AVAILABLE FOR MASS TRANSIT SYSTEMS. RURAL STATES' TRANSPORTATION NETWORKS SHOULD NOT SUFFER SIMPLY TO INCREASE THE FUNDING OPPORTUNITIES FOR URBAN TRANSIT SYSTEMS.

WE PROPOSE AND SUPPORT A 90% FEDERAL SHARE FOR THE "NATIONAL HIGHWAY SYSTEM" PROGRAM, INCLUDING THE BRIDGES ON THIS SYSTEM, AND A MINIMUM 75% FEDERAL SHARE FOR THE PROPOSED URBAN/RURAL PROGRAM. BRIDGES ON THE URBAN/RURAL SYSTEMS SHOULD REMAIN ELIGIBLE FOR AN 80% FEDERAL MATCHING RATIO. ALSO, THE FEDERAL SHARE FOR IDENTIFIED SAFETY PROJECTS SHOULD REMAIN AT 90%.

## Funding Split Between Programs

At this stage in formulating a new surface transfer program, the proposal that has evolved from the AASHTO 2020 effort contains equity provisions that Arkansas supports. Specifically, AASHTO recommends a categorical program for highways of national significance and a flexible, or urban/rural program. The Administration's proposed legislation recommends a funding split between the programs of 50%-50% with a 20% transfer provision between the programs to deal with various unique needs. The AASHTO proposal contains a provision for an 85% return for funding the categorical program and a 100% return on Trust Fund contributions for the flexible portion of the program. This will result in an overall return of Federal dollars of approximately 95%. Anything less will only continue the same unfair and unacceptable funding distribution that our state is currently enduring. Now that the system of Interstate routes is complete, the time is right to correct this funding inequity.

We also understand that the Administration's proposed legislation recommends that approximately 67% of the funding available for the proposed system of "National Highway System" and Urban/Rural Programs will go to the "National Highway System." As stated previously, we favor a 50%-50% split.

## Equity - Highway Trust Fund

We believe a very important issue, and one that must be looked at objectively by Congress, is the issue of equity. It is imperative that any new Federal program provide greater equity.

In 1990, statistics indicate that Arkansas was a donor state and received only 72 cents from each dollar our motorists contributred to the Highway Trust Fund. Arkansas is not a wealthy state. As was mentioned previously, our needs are growing at an alarming rate. Yet, due to current Highway Trust Fund distribution policies, we are actually subsidizing other states' Federal highway and public transportation programs, while our own needs continue to grow and remain unfunded.

Preliminary calculations indicate Arkansas would fare better under the Administration's proposal for a new Surface Transportation Program than in the past. While we would still be a donor state, the degree would be reduced. In order to assure that the serious inequities that Arkansas, as well as other states, experienced in the past will not reoccur, we recommend a provision be inserted in the Reauthorization Act that will guarantee at least a 95% minimum return for all states.

## Equity and Increased Funding For Public Transportation

The situation with the Mass Transit Account is a major disgrace and is getting worse. With the latest increase in Federal motor fuel taxes, Arkansans are now paying almost $26 million annually into the Mass Transit Account and receive less than a million dollars back in public transportation assistance. It's as if rural states like Arkansas are simply colonies that exist only to pay massive amounts of motor fuel taxes so that a handfull of major urbanized cities can try to solve their congestion problems. The allocation formulas, rules and regulations, and discretionary spending overwhelmingly favor programs dominated by big city transit agencies. While people in the nation's major metropolitan areas enjoy the luxury of sophisticated subways and sleek bus systems, Arkansans are suffering economic deprivation from a lack of adequate mobility assistance.

The time to bring equity into this program is now. The choices are clear. Congress must provide a transit program that contains an allocation process that deals fairly with rural transportation needs. If a compromise on allocation formulas is not possible, then some form of minimum allocation of at least 70% guaranteed return to the states should be provided combined with administrative flexibility to deal with unique rural problems. In the absence of either of these solutions, we would advocate a termination of Federal assistance to public

MASS TRANSIT AND ALLOW THE CITIES TO DEAL WITH THEIR TRANSPORTATION PROBLEMS WITH THEIR OWN RESOURCES. ARKANSAS SIMPLY HAS TOO MANY TRANSPORTATION PROBLEMS AND TOO FEW DOLLARS TO CONTINUE TO SUBSIDIZE A TOTALLY UNFAIR, INEQUITABLE PROGRAM FROM WHICH OUR CITIZENS RECEIVE LITTLE OR NO BENEFITS.

THE AASHTO PROPOSAL IS AN ACCEPTABLE METHOD OF DEALING WITH THE CURRENT INEQUITY AND WOULD INCREASE ASSISTANCE FOR RURAL AND SMALL URBAN AREA PUBLIC TRANSPORTATION NEEDS.

THE PROPOSED FORMULAS AND FUNDING METHODOLOGY CONTAINED IN THE AASHTO RECOMMENDATION WOULD PROVIDE SIGNIFICANTLY MORE MONEY TO ARKANSAS FROM THE MASS TRANSIT ACCOUNT. ADDITIONALLY, THE AASHTO TRANSIT MEASURE, AS PROPOSED, ALLOWS BROADENED FLEXIBILITY IN THE USE OF TRANSIT FUNDING THAT WILL PERMIT ARKANSAS TO MORE ACCURATELY TARGET THE FEDERAL ASSISTANCE TO OUR UNIQUE MOBILITY NEEDS. THIS IS A NECESSARY AND NEEDED CHANGE IN EXISTING POLICY AND WOULD PROVIDE THE STATES WITH THE ABILITY TO UTILIZE FUNDS FOR RELATED HIGHWAY IMPROVEMENTS WHERE IDENTIFIED TRANSIT NEEDS HAVE BEEN MET. THIS WOULD HELP ASSURE ALL POSSIBLE SURFACE TRANSPORTATION NEEDS ARE ADDRESSED.

CONVERSELY, THE ADMINISTRATION'S PROPOSAL FOR A NEW UMTA PROGRAM CONTINUES THE SAME INEQUITABLE BIG CITY-TYPE PROGRAM THAT HAS PROVIDED LITTLE HELP FOR RURAL STATES LIKE ARKANSAS.

## Responsive Allocation Formula

Next it is necessary to discuss a controversial, but critical, subject that must be addressed in the next Federal Surface Transportation Proposal. It is the issue of a fair and responsive allocation formula.

It is appropriate to say that the first goal of a new Federal transportation policy must be to preserve our existing system of Interstate highways and major arterials, or as is being proposed, the "National Highway System."

Extensive studies undertaken by AASHTO and adopted by the Federal Highway Administration document conclusively that, by far, the major contributor to highway deterioration is the extensive use by heavy trucks. States with a high concentration of heavy trucks will incur significantly higher rehabilitation costs than those with low truck volumes. Therefore, an element that reflects truck usage should be a major factor in any new allocation formula.

From reviewing the proposed legislation, it was determined that apportionment is based 70% on the ratio of highway use of motor fuels.

While a number of possibilities exist, our review of data collected and supplied by the various states indicates that diesel fuel consumption is currently the most reliable and accurate indicator of highway use by heavy trucks. It is.

THEREFORE, OUR RECOMMENDATION THAT A FAIRER RATIO WOULD BE 35% ON THE BASIS OF GASOLINE AND 35% ON THE BASIS OF DIESEL FUELS. THE USE OF DIESEL FUEL AS A FACTOR WILL NOT ONLY REFLECT TRUCK USAGE AND ACCOUNT FOR DAMAGE TO HIGHWAYS DONE BY HEAVY TRUCKS, BUT WILL ALSO PRODUCE A STRONG INCENTIVE FOR STATES TO CRACK DOWN ON FUEL TAX EVASION, WHICH SHOULD INCREASE REVENUES INTO THE HIGHWAY TRUST FUND AND PROVIDE MORE REVENUES AT THE STATE LEVEL.

WE REALIZE THAT SEVERAL PROPOSALS EXIST NOW AND THAT MANY MORE WILL SURFACE BEFORE A DECISION ON A NEW FORMULA IS REACHED. THE FEDERAL HIGHWAY ADMINISTRATION'S PROPOSED ALLOCATION PROVIDES A MAJOR IMPROVEMENT TOWARD EQUATING NEED WITH FUNDING. IF THE FUEL ELEMENT IN THIS FORMULA WAS DIVIDED EQUALLY BETWEEN GASOLINE AND DIESEL, RECOGNITION OF THE IMPACT OF HEAVY TRUCK VOLUMES WOULD BE ACCOUNTED FOR. WITH THIS REVISION, THE ADMINISTRATION'S PROPOSAL WOULD BE MORE ACCEPTABLE AS PROVIDING FOR ARKANSAS' NEEDS.

## COST ALLOCATION

THE FINAL REPORT ON THE "FEDERAL HIGHWAY COST ALLOCATION STUDY" THAT WAS MANDATED BY SECTION 506 OF P.L. 95-599, THE 1978 SURFACE TRANSPORTATION ACT, WAS SUBMITTED TO CONGRESS IN MAY, 1981, BY THE SECRETARY OF TRANSPORTATION.

THIS REPORT WAS USED BY CONGRESS TO ALTER THE HIGHWAY USER FEES PAID BY HEAVY VEHICLES TO BRING THEM MORE IN LINE WITH WHAT THEY SHOULD BE PAYING. SINCE THE STUDY INDICATED HEAVY VEHICLES WERE NOT PAYING THEIR FAIR SHARE TO MAINTAIN AND CONSTRUCT THE NATION'S HIGHWAY SYSTEM.

RECENTLY, THE AASHTO HIGHWAY SUBCOMMITTEE ON HIGHWAY TRANSPORT COMPLETED A STUDY TO DETERMINE THE ACTIVITY OF THE STATES IN CONDUCTING THEIR OWN HIGHWAY COST ALLOCATION STUDIES.

IT WAS FOUND FROM THIS REPORT THAT 21 STATES HAVE CONDUCTED THEIR OWN COST ALLOCATION STUDY SINCE 1977 AND FOUR OF THESE STATES ARE CURRENTLY UPDATING THEIR STUDIES. IN ADDITION, THREE OTHER STATES ARE NOW CONDUCTING A COST ALLOCATION STUDY. UNFORTUNATELY, 26 STATES HAVE NEVER MADE A STUDY OF THIS NATURE, BUT HAVE RELIED ON THE OUTCOME OF THE OTHER STATES, AS WELL AS THE NATIONAL REPORT TO ASSIST THEM IN DETERMINING THE FEES TO BE CHARGED TO THE HEAVIER VEHICLES.

IT HAS NOW BEEN OVER EIGHT YEARS SINCE THE FEDERAL HIGHWAY COST ALLOCATION STUDY WAS COMPLETED AND THE NUMBER OF HEAVY VEHICLES HAVE CONTINUED TO INCREASE. IT IS NOW TIME THAT THIS STUDY BE UPDATED AND THAT A NATIONAL WEIGHT DISTANCE TAX BE SERIOUSLY CONSIDERED AS A METHOD TO COLLECT HIGHWAY REVENUES FROM THE HEAVIER VEHICLES IN LIEU OF CONTINUING TO RAISE THE TAX ON DIESEL FUEL.

## Truck Length and Weight Limits

There are currently several proposals being discussed to increase truck length and weight limits. Because of the large volume of trucks that travel our roads and highways, Arkansas will be heavily impacted with respect to safety and accelerated road and bridge damage by any changes that increase Federal truck size and weight legislation.

We strongly recommend that no changes be made to either the length or weight limits.

## National Highway System

Various discussions and meetings are now being held in our state, as well as the nation, on the very controversial issue of the size of the proposed "National Highway System."

Although recent discussions with FHWA officials have resulted in some improvement in mileage allocations and route inclusions, the level now being proposed by the Administration for Arkansas will only provide approximately 2,000 miles for the rural system, including the present Interstate mileage. This will omit many of Arkansas' major routes. These omitted routes are statewide routes that have been identified for expansion and for many reasons need to be included in this category.

STILL, SINCE THE SIZE OF THE SYSTEM AND THE DISTRIBUTION OF FUNDS ARE NOT TIED TOGETHER, WE BELIEVE EACH STATE SHOULD HAVE FLEXIBILITY IN DETERMINING THE SYSTEM SIZE IN THEIR STATE. WE FURTHER BELIEVE THAT THE PROCESS USED TO ARRIVE AT THE SIZE OF THE SUGGESTED SYSTEM, OR THE CAP IN NUMBER OF MILES, IS SO FLAWED AND SO CONTROVERSIAL THAT A CONCENSUS WILL NEVER BE REACHED.

ALSO, SINCE THE INTERSTATE SYSTEM IS NEARING COMPLETION, IT IS NOT NECESSARY TO IDENTIFY A SEPARATE SMALL SYSTEM AND REPORT THE COST TO COMPLETE EVERY TWO YEARS. IT IS TIME TO PROVIDE A PROGRAM THAT WILL LET EACH STATE DEAL WITH THEIR OWN UNIQUE NEEDS IN SYSTEM DESIGNATION, AS WELL AS FUNDING AS DISCUSSED EARLIER.

THE ORIGINAL 4% FOR RURAL AND 10% FOR URBAN AS EARLIER DISCUSSD AND CONSIDERED BY THE FEDERAL HIGHWAY ADMINISTRATION AND AASHTO SEEMS TO WORK WELL IN ARKANSAS. IT ALLOWS FOR A SYSTEM OF APPROXIMATELY 3,500 MILES AND COVERS MOST OF THE MAJOR TRAVELED CORRIDORS. THIS SYSTEM SIZE FOR ARKANSAS WILL RESULT IN A REDUCTION IN EXISTING ELIGIBLE MILES ON THE INTERSTATE AND PRIMARY SYSTEM OF APPROXIMATELY 50%, OR 3,500 MILES, AND IS BELIEVED TO BE MORE IN LINE WITH A "REDUCED SYSTEM."

THEREFORE, IN LIEU OF THE 150,000 MILE NATIONWIDE LIMIT AS NOW PROPOSED BY FHWA, WE RECOMMEND A MILEAGE LIMITATION OF 200,000 MILES FOR THE NATIONAL HIGHWAY SYSTEM. THIS WILL ALLOW THOSE STATES DESIRING A LARGER SYSTEM THE FLEXIBILITY NEEDED.

## Highway Trust Fund Issues

At this point, it may be a good idea to look at Arkansas' status relative to the Federal Highway Trust Fund. Budget balancing practices, inequitable apportionment formulas, unfavorable funding decisions, and other limitations have resulted in a continual decline in the amount of Federal Aid Arkansas receives. One cannot help but question the Federal Government's role in providing a continuing reliable source of highway funding and, at the same time, use the Trust Fund in dealing with the deficit. The Highway Trust Fund must be protected from such budgeting balancing action by removing it from the unified Federal budget.

Additionally, we support a drawdown in the existing balance of the Highway Trust Fund. The additional funds can, and should be, utilized NOW on deteriorating highways and to provide needed economic development access.

While the Administration's proposal does increase funding significantly in F.Y. 1996, based on recent recommendations by the House Public Works and Transportation Committee and a GAO report, it appears that the entire Federal Program level can be increased significantly over existing levels and the Administration's proposal.

## Cost and Time of Construction

Another issue that we continue to hear more and more about from our constituents is that of the cost of Federal aid construction and the accompanying burdensome and time consuming red tape. The Federal aid process can result in taking several years to advance a project on new location to contract. This is entirely too long. Now that we have additional requirements in the environmental area due to the so called "no net loss" wetlands policy, it may take even longer, and in some cases a project may be completely halted. Also, the relocation requirements and rigid categories and standards all combine to expand the cost and increase the implementation time for Federally aided projects. It is imperative that any new program deal effectively with simplifying these issues so that States can provide the public with <u>timely</u> improvements. It is becoming very difficult to understand, much less explain to the public, why the process takes so long.

## Budget Balancing Process

Another problem area that must be discussed and addressed by Congress now is the concept of raising taxes on motor fuels and petroleum products for budget balancing purposes. The recently passed budget reconciliation act which increased the Federal motor fuel tax by five cents, further compounds this problem.

RAISING HIGHWAY USER TAXES TO BALANCE THE BUDGET IS NOT THE ANSWER. ACCORDING TO RECENT FEDERAL STATISTICS, ARKANSAS RANKS HIGHEST IN THE NATION IN MOTOR FUEL CONSUMPTION PER REGISTERED VEHICLE. ANY ATTEMPT TO BALANCE THE BUDGET THROUGH INCREASED FUEL TAXATION WILL FALL MOST HEAVILY ON ARKANSAS' ROAD USERS. ALREADY, OUR ECONOMY IS SUFFERING. THERE IS SIMPLY NO JUSTIFICATION FOR ARKANSAS HAVING TO BEAR A DISPROPORTIONATE SHARE OF SOLVING THE NATION'S FINANCIAL PROBLEMS.

IT IS IMPERATIVE THAT ALL FUTURE FUNDS COLLECTED FROM THE ROAD USER REMAIN DEDICATED ONLY FOR HIGHWAY PURPOSES.

## DELTA CONSIDERATIONS

FINALLY, THERE IS AN ISSUE THAT AFFECTS A MAJOR REGION IN OUR NATION THAT HAS BEEN VIRTUALLY IGNORED IN ALL OF THE TRANSPORTATION REAUTHORIZATION PROPOSALS. IT DEALS WITH PROVIDING TRANSPORTATION FACILITIES TO HELP REVITALIZE THE ECONOMICALLY DEPRESSED MISSISSIPPI DELTA REGION.

IN 1988 CONGRESS APPROPRIATED A SUBSTANTIAL SUM OF MONEY TO STUDY THE NEEDS OF THIS REGION. I THINK YOU WILL BE IMPRESSED WITH THE STUDY'S RECOMMENDATIONS AND THE PROGRESS MADE SO FAR.

THE STUDY RECOMMENDED "THAT CONGRESS PRIORITIZE FUNDING FOR THE GREAT RIVER ROAD AND PROVIDE FUNDS FOR ITS COMPLETION." NUMEROUS ORGANIZATIONS SUCH AS THE MISSISSIPPI RIVER PARKWAY COMMISSION ARE ALREADY AGGRESSIVELY PURSUING THE ACCOMPLISHMENT OF THIS RECOMMENDATION.

ALSO, THE STUDY RECOMMENDS THAT THE STATES SHOULD CREATE A REGIONAL CONSORTIUM TO GUIDE DEVELOPMENT OF HIGHWAY TRANSPORTATION FOR ECONOMIC DEVELOPMENT. THIS CONSORTIUM OF SEVEN DELTA STATES HAS ALREADY BEEN ESTABLISHED AND APPOINTED REPRESENTATIVES ARE MEETING THIS FRIDAY IN FORREST CITY, ARKANSAS, TO PURSUE THE IMPORTANT OBJECTIVE.

ADDITIONALLY, THE STUDY RECOMMENDS THAT THE "STATES SHOULD PROVIDE ADDITIONAL FINANCIAL RESOURCES THROUGH INCREASED FUEL TAXES OR BOND ISSUES TO MEET UNFUNDED HIGHWAY AND BRIDGE CONSTRUCTION AND EXPANSION REQUIREMENTS IN THE DELTA." THIS IS ALREADY BEING ACCOMPLISHED. AN EXCELLENT EXAMPLE IS OUR OWN RECENTLY APPROVED PROGRAM THAT CALLS FOR A LARGE INCREASE IN THE STATE'S MOTOR FUEL TAXES TO FUND A MAJOR HIGHWAY PROGRAM. A SIGNIFICANT AMOUNT OF THE FUNDS WILL BE SPENT IN THE 42 COUNTIES THAT COMPRISE THE LOWER MISSISSIPPI DELTA REGION. OVER 2,500 MILES WILL BE IMPROVED IN THE DELTA REGION, INCLUDING MANY OF THE HIGHWAY PROJECTS SPECIFICALLY RECOMMENDED IN THE LOWER MISSISSIPPI DELTA DEVELOPMENT COMMISSION'S REPORT TO CONGRESS. HIGHWAY IMPROVEMENT IN THE DELTA IS A HIGH PRIORITY.

FINALLY, THE STUDY RECOMMENDS THAT CONGRESS AND THE PRESIDENT SHOULD FUND SEVERAL CRITICAL MULTI-STATE HIGHWAY PROJECTS IN THE REGION. THIS, OF COURSE, IS WHERE WE NEED YOUR HELP. IT IS CRUCIAL THAT A NEW FEDERAL TRANSPORTATION PROGRAM RECOGNIZE AND ACCOMMODATE THE NEED TO FUND PROJECTS TO STIMULATE RELIEF FOR ECONOMICALLY DEPRIVED REGIONS OF OUR NATION. THERE

IS AMPLE PRECEDENT FOR THIS TYPE OF ACTION AS EVIDENCED BY THE SUCCESS OF THE APPALACHIAN REGIONAL PROGRAM. WE SINCERELY HOPE YOU WILL INCLUDE THIS EFFORT IN YOUR DELIBERATING FOR A NEW TRANSPORTATION PROGRAM.

## CLOSING

IN SUMMARY, WHILE WE ARE PLEASED WITH THE GENERAL INTENT OF THE ADMINISTRATION'S PROPOSED NEW LEGISLATION, WE ARE VERY CONCERNED ABOUT SEVERAL OF THE ISSUES, SOME OF WHICH WE HAVE DISCUSSED TODAY. WE ASK THAT THIS COMMITTEE ESPECIALLY CONSIDER OUR RECOMMENDATIONS ON MATCHING RATIOS, MILEAGE ALLOWED FOR THE "NATIONAL HIGHWAY SYSTEM," FUNDING SPLIT AND FLEXIBILITY BETWEEN NHP AND THE URBAN/RURAL PROGRAM AND THE MINIMUM ALLOCATION PROVISIONS.

THANK YOU AGAIN FOR AFFORDING US THIS OPPORTUNITY TO EXPRESS OUR CONCERNS AND CONTRIBUTE TO THE IMPORTANT PROCESS OF FORMULATING NEW HIGHWAY LEGISLATION. A RESPONSIVE AMERICAN TRANSPORTATION SYSTEM WILL BE REQUIRED TO MEET OUR EVER CHANGING NEEDS AND PROVIDE THE NATION MOBILITY AS WE MOVE INTO THE 21ST CENTURY.

THE ARKANSAS HIGHWAY COMMISSION AND THE ARKANSAS STATE HIGHWAY AND TRANSPORTATION DEPARTMENT STAFF WISHES TO COMMEND NOT ONLY THIS SUBCOMMITTEE, BUT ALSO THE HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE FOR THIS VERY IMPORTANT AND TIMELY LEGISLATIVE REVIEW. ONLY TIME WILL TELL HOW SUCCESSFUL ALL OF OUR EFFORTS HAVE BEEN.

Fort Smith, Arkansas
April 22, 1991

Testimony For

Surface Transportation Sub-Committee

By

H. L. Hembree, III

Fort Smith, Arkansas
April 22, 1991

Chairman Mineta, Congressman Hammerschmidt and members of the Surface Transportation Sub-committee, I would like to thank you for coming to Fort Smith for this hearing and also for allowing me the opportunity to speak to you on behalf of the citizens of this area. I am H. L. Hembree, Managing Partner of Sugar Hill Partners, and I have been involved in a variety of corporations throughout the nation for over thirty-five years. My primary interests and base of operations have been here in western Arkansas and in preparing for your visit it occurred to me that throughout this period we have been trying to get support for a decent North-South highway system through this area.

I extracted the following from a publication in November, 1966, that stated: "H. L. Hembree, Secretary-Treasurer of the Sebastian County-Fort Smith Area Planning Commission showed slides and spoke on the makeup of the 21-county area represented by the Western Arkansas Development Association, Inc., which is chaired by J. Fred Patton. Purpose of the group is to further develop the plans for a turnpike from the Missouri line to Louisiana, running through the western section of-Arkansas. Missouri and Louisiana are also working on the project; the overall goal being to build the turnpike from Kansas City to New Orleans." Ladies and gentlemen, we are gathered here today, some 25 years later, discussing the same subject. I have to believe there is a message here. Our economic growth has far exceeded the development of our transportation network and today the lack of a four-lane interstate highway along this North-South corridor is a more serious problem than ever before.

We are not just talking about a nice four-lane highway that runs through this area--- we are talking about connecting middle America and allowing true economic growth in all of the surrounding states. Highway safety is another major factor to be considered.

At one time truck traffic going to Houston and Shreveport came through here. Today, it all goes elsewhere, at a greater cost. The Kansas City to Shreveport run was the crust of the old Arkansas Motor Freightways. The company was actually built on the success of this run. Today, not a single schedule runs between these points. Trans-States Lines (TSL) will operate eight to ten schedules between Fort Smith and Houston today. Can you imagine what it would mean to have this last segment completed between Fort Smith and Texarkana? We are most appreciative of the support and progress being made on U.S. 71 to the North but until we get this connection to the South, we will never be able to open up middle America and be able to enhance the opportunities for business and industry along this corridor.

Only last week while driving on Interstate 40 enroute to Little Rock, I noticed the marked difference between the development on it versus our State Highway 22 on the other side of the river. Plain and simple, the volume of traffic has made that difference. Accordingly, when driving on Highway 71, you see the decayed motels due to lack of traffic as well as lack of good local restaurants. This situation should not exist since there are over 45 million people living in these Mid-America states. Many of these people are actually afraid to travel Highway 71 because it is narrow and crooked and they do not want to add to the large number of fatalities that continue to occur each year on these highways. We need your help to find a way to create a program whereby we can get this long-awaited project underway now! The next time I testify before this committee, I would love to say, "Thank you, ladies and gentlemen, for a job well-done."

STATEMENT BY

ANN HENDERSON

EXECUTIVE DIRECTOR

ARKANSAS TRANSIT ASSOCIATION

BEFORE THE

SURFACE TRANSPORTATION COMMITTEE

OF THE

HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

REGIONAL HEARING ON REAUTHORIZATION
OF FEDERAL HIGHWAYS AND MASS TRANSIT PROGRAMS

FORT SMITH, ARKANSAS
APRIL 22, 1991

Mr. Chairman:

My name is Ann Henderson and I am the Executive Director of the Arkansas Transit Association. Thank you for inviting me to testify before you today on the importance of public transportation in our state and how critical federal assistance is to make this basic service available for all Arkansans.

Our statewide association represents over 100 properties supported by the Urban Mass Transportation Administration, and our members include transportation providers ranging from Central Arkansas Transit in Little Rock with 60 buses to elderly and handicapped agencies who serve special constituents throughout the state.

Specifically, Arkansas has four Section 9 urban (fixed-route) systems and eight Section 18 rural (fixed-route and demand response) systems. These twelve public transportation agencies serve only twenty-five of the seventy-five counties in Arkansas. There are approximately 100 paratransit agencies that serve their own clientele of elderly and handicapped citizens.

Costs for these transportation providers have risen significantly over the years. The price of vehicles has increased and, in light of the Americans with Disabilities Act and the Clean Air Act, these prices will escalate even higher. Maintainence and operating costs, including higher

minimum wages and insurance, and certainly now rising fuel costs, will make it impossible to provide the needed services on current funding levels.

Public transit providers recognize and support the need for good streets and highways. However, more federal assistance for the transportation of people is critical. Public transportation is needed for low income workers, the elderly and the disabled.

Arkansas ranks third in the nation in the percentage of elderly population. We rank near the top in the nation in the total number of disabled people, including the physically handicapped as well as those with mental and developmental disabilities. In addition, Arkansas ranks first in motor fuel consumption per registered vehicle.

For every gallon of gas purchased, each state pays one and one-half cents into the Mass Transit Account of the Federal Highway Trust Fund. This account is distributed back to the states for transit. In 1988, Arkansas paid over 14.5 million dollars into the MTA Account. However, we received back less than $600,000. Arkansas ranked 50th in the nation in return of those funds that year. In 1989, Arkansas motorists paid $17,196,750; only $760,747 was returned to our state. In other words, for every dollar paid, we got back only four cents! Moreover, the percentage of return has worsened with the new federal gas tax. We will now pay over twenty-five million dollars into the account, but our return will be less than three cents for each dollar contributed. Arkansas truly is a donor state.

There appears to be a bias in the federal funding formulas toward big rail systems. While rail is appropriate for the seven or eight largest areas in the country, the vast majority of the country needs adequate funding for buses, minibuses and vans. We need an equitable and guaranteed return of Mass Transit Account funds to the states, similar to the guaranteed percentage of money returned for highways. That highway percentage is currently 85 percent. Furthermore, states need the flexibility to use those funds for the Section 18 rural systems.

Urban and rural systems depend upon operating assistance. In real dollar terms, federal operating assistance today is one half of what it was in 1980. A cut or reduction of these funds would certainly have a devastating effect.

Arkansas is basically a rural state. Everyday lack of mobility impacts thousands of Arkansans by being the most significant barrier to basic health and human service needs. These individuals must depend on limited public transit, service agencies, family, neighbors, and volunteer organizations for transportation. Less than one-half are being afforded adequate transportation for such basic needs as medical care, shopping, education and employment.

Forty-two counties in the eastern half of Arkansas are part of the region recently studied by the Lower Mississippi Delta Development Commission. Included are some of the poorest counties in the country; and out of those forty-two counties, public transportation is available in only six.

Dr. Joycelyn Elders, Director of the Arkansas Department of Health, stated recently that the greatest barrier to health care in Arkansas is transportation. She said that people who can afford health care have transportation. But people cannot get health care if they cannot get to the service.

To illustrate, let me tell you a story that happened just a few short months ago at one of our rural systems, Mid-Delta Transit in Helena, located on the Arkansas River. A fifteen year old girl with a newborn child met the bus at its scheduled stop in the small community of Marvell. Even though she did not have enough money for the fare, she asked if she could take her baby to the doctor in Helena, some fifteen miles away. The driver probably stretched procedures to let her ride free, but it was lucky for the baby that she did. The doctor hospitalized the infant immediately for a life-threatening illness. The child survived, but the outcome might have been much less fortunate if the transportation had not been available. Indeed, public transportation impacts peoples' lives every single day.

Recently, Congressman Ray Thornton from Arkansas called for more federal support of public transportation in rural areas. He said, "We need to improve public transit, and we need to strengthen the federal commitment for those people who cannot afford the most expensive form of transportation known to man, which is everybody jumping in his own car and going."

In Arkansas, this private form of transportation is not available to a significant - and increasing - number of citizens. These are transportation-dependent individuals. It does not matter how much we spend on improving our highway system; these people cannot benefit because so often they have no means of accessing this basic mode of transportation.

It is evident we have needs that are not being met. We are making progress, but there is much to be done. The Administration's proposal goes some distance in recognizing some of these needs. While we do not feel like it is nearly enough support under the transit portions, they do seem to recognize the necessity for funding rural providers and those serving the elderly and the handicapped.

However, there is also a proposal before the committee recently introduced by Congressman Nick Rahall, along with Congressman Beryl Anthony of Arkansas and over thirty of your colleagues, including a dozen members of this subcommittee. This bipartisan effort goes even further to support the public transportation crisis, and in our judgment, deserves your very serious consideration. I am talking about H.R. 1079, the Mobility Assistance Act of 1991.

The Mobility Assistance Act is designed to increase assistance for public transportation across the board. No one loses, and everybody wins. For states like Arkansas, it helps target increases for small urban, rural and paratransit providers that have historically been under-funded.

We applaud the Administration's recognition that the name of the Urban Mass Transit Administration should be changed. However, I personally support the Mobility Assistance Act's name change to the Federal Public Transportation Administration. I fight the perception every day that our state does not have "mass transit". As one state senator put it, "We ain't got no subways in Arkansas." It is difficult to convince our local citizens that the same pot of money paying for big city rail systems also helps their mom get to the senior center.

Only through expanded and improved public transportation services can these people reap the rewards of opportunities available to them. Today, I cannot help but reflect that it is much easier for a citizen of East Berlin to get to West Berlin than it is for some people to get from West Memphis, Arkansas, to Memphis, Tennessee.

As jobs, goods and services move to regional centers, we cannot afford to leave behind the transportation-dependent -- the poor, the elderly, those with disabilities, and willing workers. As we focus on our future, it is imperative that transportation issues go beyond the emphasis on moving vehicles to include strategies for moving people.

TESTIMONY

OF

HONORABLE STEVE HETTINGER
MAYOR, CITY OF HUNTSVILLE
P. O. BOX 308, HUNTSVILLE, ALABAMA 35804
205-532-7304

REPRESENTING
THE ALABAMA, GEORGIA, MISSISSIPPI AND TENNESSEE COALITION

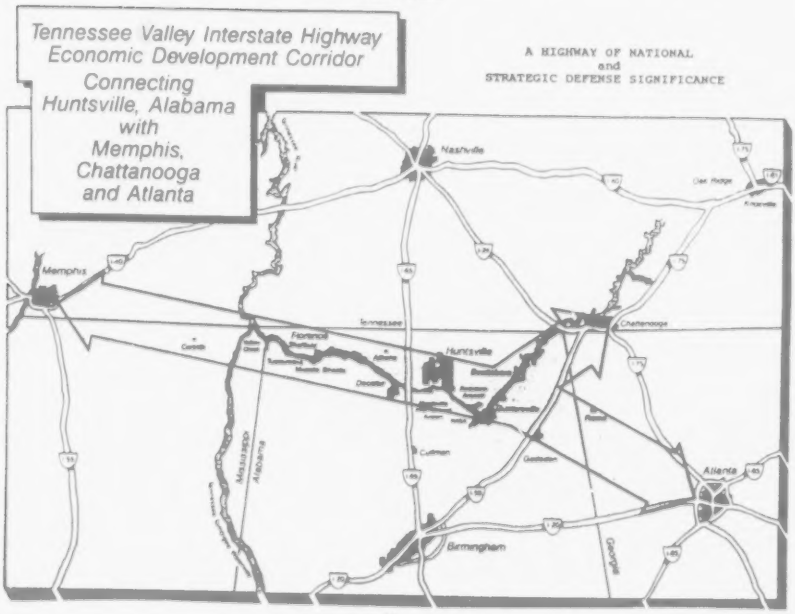
BEFORE
THE SUBCOMMITTEE ON SURFACE TRANSPORTATION
OF THE
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
UNITED STATES HOUSE OF REPRESENTATIVES

REGIONAL HEARING

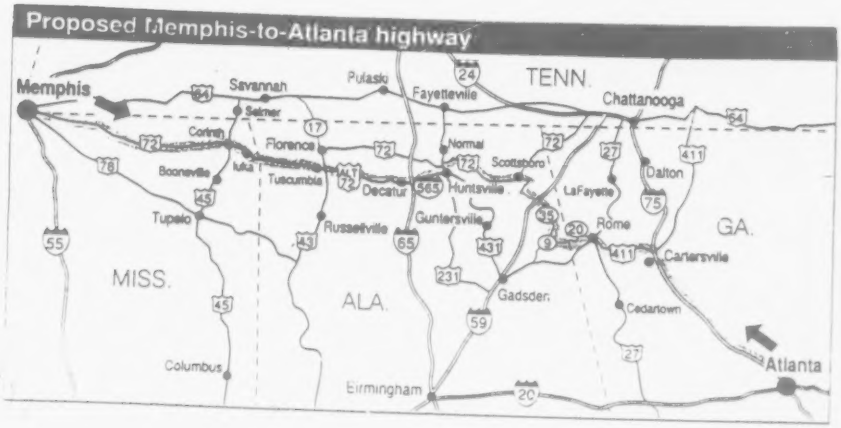
APRIL 22, 1991

ON
AUTHORIZATION OF THE POST-INTERSTATE
SURFACE TRANSPORTATION PROGRAMS

FOR THE

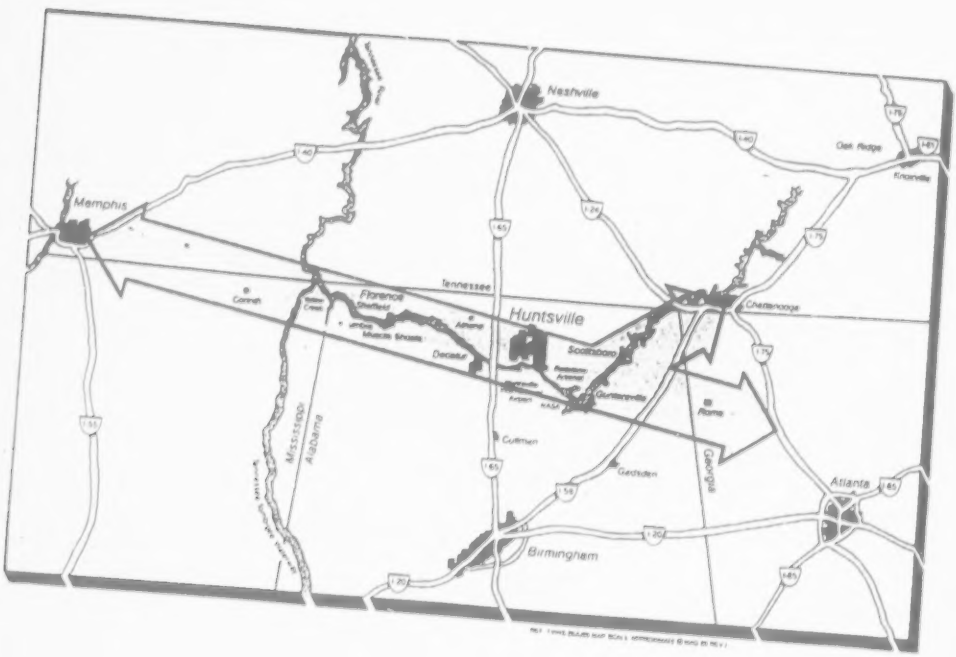


Mr. Chairman and distinguished members of the Subcommittee on Surface Transportation, I am Steve Hettinger, Mayor of Huntsville, Alabama, representing not only that great city, but also a four State coalition of Mayors, elected officials, councils of government and citizens, requesting that you authorize the necessary mileage for the construction of a Highway of National Significance built to interstate specifications from Memphis to Huntsville to Atlanta and from Huntsville to Chattanooga. Without Federal leadership and legislative direction multi-state needs will not be met. Our desire today is to present such a project to you.

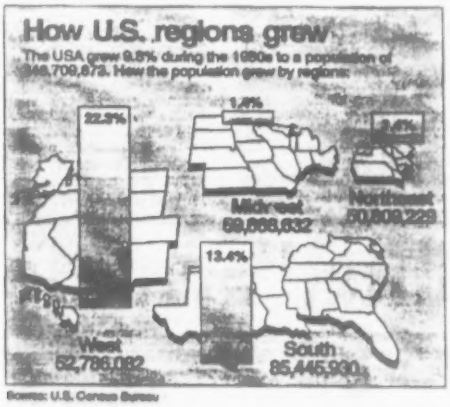


Atlanta, the 12th largest metropolitan area in the U.S., and Memphis, are unique in that they are not directly connected by an Interstate even though the planning criteria was to connect cities of 50,000 or more by the 1950 census. We are an east/west oriented transportation region between these two great cities due to the Tennessee River and Norfolk Southern Railway's main line from Memphis to Chattanooga, both of which parallel the river most of that distance. Even though north/south I-65 runs from Birmingham to Nashville, it only passes through North Alabama; it does not have a connector to a single city. I-565, a connector from I-65 through the downtown business district (DBD) of Huntsville, 22.1 miles, was authorized January, 1969, however, it is under construction, completion scheduled for Fall of 1991.

As reflected by this map, over 50% of North Mississippi, 40% of North Alabama and 30% of North Georgia are not served by an east/west Interstate Highway, having been left out of what has become the single most important economic development factor of this century, the 44,000 mile Interstate System (National Defense Highway Transportation System) that was authorized in 1956. This is a land mass larger than most states.



The shocker out of all this is that this land mass is right in the middle of the second highest growth region in the U.S., the South, accounting for over one-third of the Nation's population growth in the past decade.

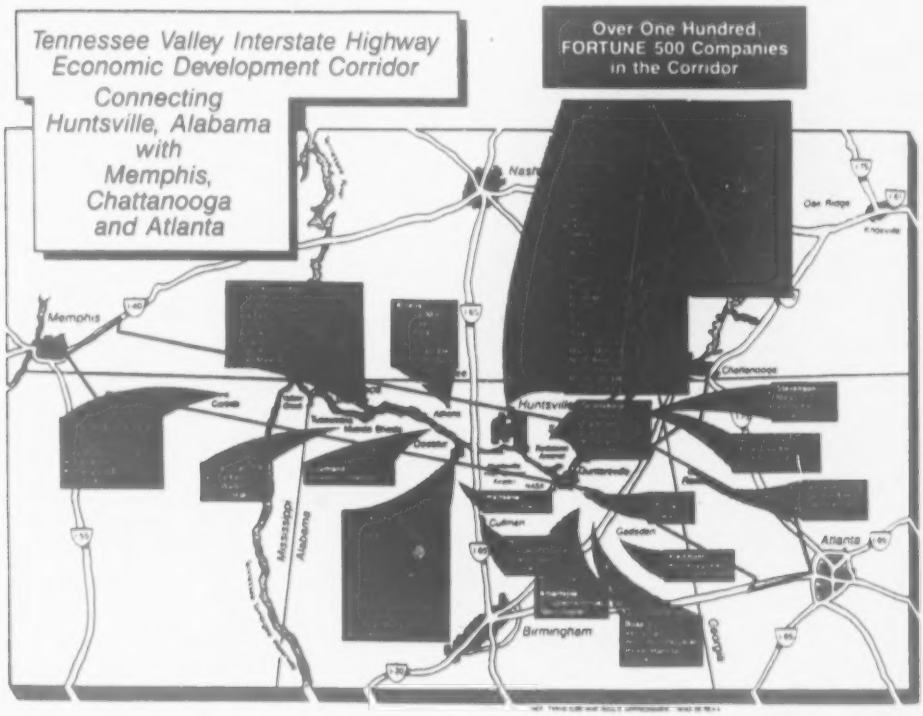


North Alabama accounted for 60% of Alabama's growth during the 80's. Huntsville and Madison County accounted for 44% of that total growth for the State, consistently being ranked as one of the top "economic hot spots" in the country. Between Memphis and Atlanta today along the Corridor route are four metro areas: Gadsden, Huntsville, Decatur and Florence. The MSA's alone that would be directly served by this corridor route, selected by the highway departments of Alabama, Georgia, Mississippi and Tennessee, account for a population of almost 5 million.

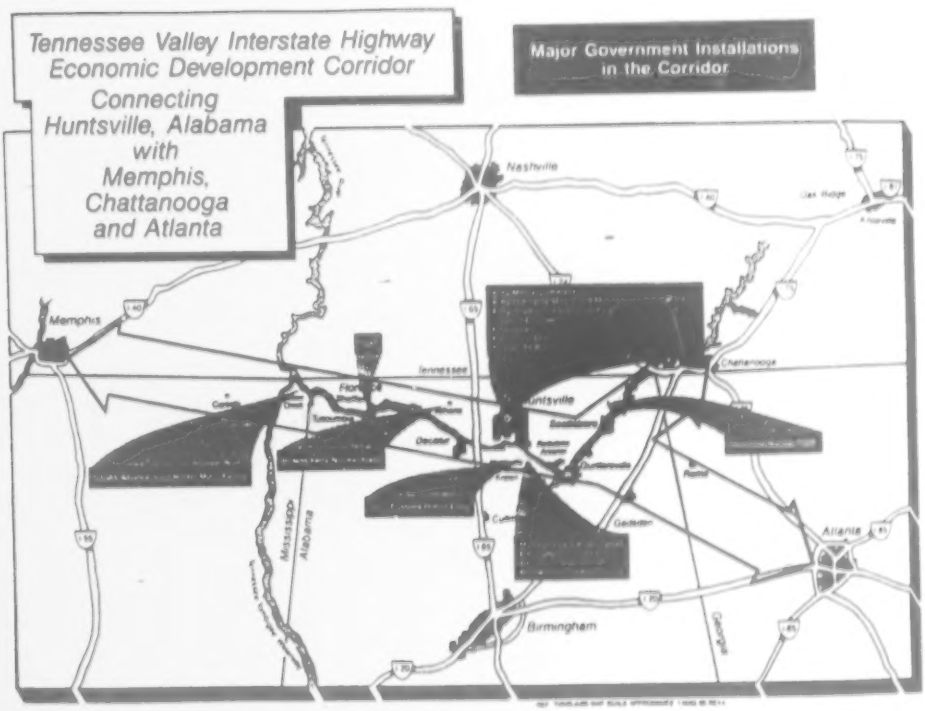
METROPOLITAN STATISTICAL AREAS
1990 CENSUS

| | |
|---|---|
| ATLANTA | 2,833,511 |
| MEMPHIS | 981,747 |
| CHATTANOOGA | 433,204 |
| HUNTSVILLE | 238,912 |
| FLORENCE | 131,327 |
| DECATUR | 131,556 |
| GADSDEN | 99,804 |
| TOTAL | 4,850,061 |

Along the Corridor route, excluding Memphis and Atlanta, are over 100 Fortune 500 companies. Of Strategic Defense Significance is the fact the route also serves Redstone Arsenal and NASA's Marshall Space Flight Center at Huntsville and the Advanced Solid Rocket Motor facility at Yellow Creek near Iuka, Mississippi, the route adding a link to the Strategic Highway Network (STRAHNET) that is demanded today.



Redstone Arsenal, Huntsville, Alabama, headquarters for the Army Missile Command, has been proposed as a military base to add personnel and roles. The Secretary of Defense made that official on April 12, 1991 in his proposal to the Base Readjustment Commission.



At this juncture in time it is your task to launch a new National Highway System Plan that will take us into the 21st Century, knowing that we must be more efficient domestically and internationally transportation-wise. We won the Persian Gulf War with speed, technology and American can do spirit. If we are to win the economic war we are now engaged in, we must improve our surface transportation system or lose the battle. The latter is both unacceptable and un-American.

**If we are to contribute and survive economically, we can not be left out of the Interstate System for another 35 years.**

While the Interstate was being built our transportation infrastructure was falling apart. Between Memphis, Huntsville and Chattanooga we still have quite a few miles of original 2 lane, pre-World War II Primary Highway still in use; a condemned bridge across the Tennessee River on U.S. 431; a draw-bridge on U.S. 31 at Decatur that backs up traffic over 5 miles when it is raised to let a 21 barge tow pass; and only the use of the rural road system to get to Atlanta. The local joke is, you need an Indian Guide to get there. It is such an obstacle course it is worthy of being a 1996 Olympic event.

What happened? The scenario is an amazing and interesting account of what transportation, education and perseverance can accomplish under such adverse transportation conditions. Here are a few of the salient features:

- Following WWII the 40,000 acre Redstone Arsenal at Huntsville, Alabama was closed but reopened to establish the Army Missile Command (AMC). Today AMC oversees the development, manufacture and deployment of the Army's arsenal of missile weaponry, training included, employing 15,000 and managing annual appropriations approximating $9 billion. They produced the Pershing Missile, our first line of defense in Europe. Few recall, however, that a Redstone rocket lofted us into the exploration of space. Everyone in the world knows today that the Patriot Anti-Missile Missile System, the Tommyhawk, the Stinger and the Multiple Launch Rocket System (MLRS) were conceived and developed by AMC at Redstone and that AMC is playing a major role in the Strategic Defense Initiative (SDI).

- In the late fifties Congress established the National Aeronautics and Space Administration (NASA), moving Von Braun's team to the Marshall Space Flight Center on Redstone Arsenal where today some 3650 scientists and engineers are employed and the operating budget is almost $3 bilion. They put man on the moon in the 60's. They are the backbone of our Space Program today.

- Huntsville has become one of the high-tech centers in the country. Every major aerospace firm has substantial personnel and facilities there.

- Yellow Creek, near Iuka, Mississippi, sitting astride the confluence of the Tennessee River and the Tennessee-Tombigbee Waterway, has been selected as the site for the Advanced Solid Rocket Motor (ASRM) facilities. Lockheed, Sunnyvale, California, has been selected as the prime contractor, supported by Aerojet Space Boosters, Sacremento, California. Employment will be in the thousands and appropriations in the hundreds of millions. Mississippi, Tennessee and Alabama are pouring millions into infrastructure projects and facilities to support and accomodate the explosive growth taking place. However, the highest infrastructure requirement is adequate connections with the nation's Interstate Highway System and NASA's Marshall Space Flight Center at Huntsville. The proposed corridor route from Memphis to Huntsville to Atlanta falls squarely across Yellow Creek and Iuka, meeting that and a STRAHNET priority, and passes within rock-throwing distance of the Marshall Center.

- The University of Alabama at Huntsville is now a full campus with an enrollment of 10,000, offering graduate and under graduate degrees. A & M University, a land grant college, has moved forward into the sciences and social studies. Oakwood College attracts students from the four corners of the world, as does A & M. Athens College, Athens, Alabama and the University of North Alabama in Florence contribute to create a spectrum of higher education across North Alabama, supplemented with a number of community colleges and vocational education schools.

- The creation of the Tennessee Valley Authority (TVA) in the early 30's caused President Franklin D. Roosevelt to make the prediction that it would make the valley, North Alabama, " . . bloom like a rose". And it did. In addition to taming the flood ravaging Tennessee River and making it navigable the year round, accomodating 21 barge tows, it generated electrical energy and provided the water resources our modernizing industries were craving. Our proposed Economic Development Corridor route parallels this great river as it courses through North Alabama and within that corridor today, as mentioned, are over 100 Fortune 500 companies with major facilities, operations and employment. TVA is a pioneer in nuclear energy and as we head into the next century they are prepared to provide electricity that will contribute further to the environmentally clean manufacturing communities we must attain, reducing our dependence on oil.

- The 9000 miles of Integrated Inland Waterway System opened up the Valley to a vast amount of the United States via river transportation and in particular the Mid-America corn country. Barges loaded with Mid-America corn are now unloaded at Decatur and Guntersville, Alabama, to support Alabama being the largest producer of poultry in the United States, 90% of this production being in rural North Alabama. Distribution of fresh dressed poultry is over America's highway system, our Interstate Highways offering the most efficient routes, in many cases the difference between profit and loss for both producer and trucker. Mississippi, Tennessee and Georgia are equally involved in poultry farming.

- The completion of the Tennessee-Tombigbee Waterway has provided the Economic Development Corridor States of our proposal with direct access to deep water via the Port of Mobile. It will never be the economic development factor it has a potential to be, however, until it is connected into the Interstate Highway System that our proposal offers.

- The Huntsville International Airport, planned in 1963 as a multi and intermodal complex, opened in 1967. Enplaning over 1 million passengers annually, service is provided by five major carriers: American, Delta, Northwest, US Air and United, plus several commuters. FAA recently identified the airport as one of four facilities in the U.S. with the excess capacity and capability to accomodate a hub operation and provide relief to our overloaded hubs.

  The International Intermodal Center provides both container and air cargo terminal facilities at one location. Norfolk Southern provides intermodal services, connecting the region to the world's intermodal ports and allowing many of our industries to compete in exporting rather than importing.

  Huntsville was established as a U.S. Customs Port of Entry several years ago and today is the second busiest port in the Mobile District. The Port of Entry Service Area was extended to include all of North Alabama and Tishomingo County, Mississippi. Foreign Trade Zone No. 83 was created to serve the airport's Jetplex Industrial Park where 14,000 are presently employed.

September 15, 1990, Cargolux inaugurated non-stop 747 all-air cargo service from Europe to Huntsville, Alabama, the only all-air cargo non-stop between Europe and the Southeast other than Atlanta. Air cargo and intermodal terminal market areas are determined by how far you can deliver via surface transportation from time of landing to 10:00 A.M. the next morning. From Huntsville that includes Nashville, Chattanooga, Knoxville, Atlanta, Birmingham, Montgomery, Mobile, Jackson, Memphis, even Little Rock. The proposed Economic Development Corridor would, therefore, enhance the availability of this service for commerce and industry along and surrounding the Corridor, especially their ability to compete in the European and beyond Berlin Wall markets. **It is significant that the deficiency we are facing in providing domestic and international air cargo and intermodal service is surface transportation in our own backyard.**

- The International Intermodal Center has the unique capability to provide container storage of non-perishables, thus eliminating warehousing, and either air-lifting them or moving them by intermodal train to a port of departure in the event of an international conflict as recently experienced in the Persian Gulf, or international catastrophe to destinations where the container continues to be a mobile warehouse. The proposed route would enhance the staging of perishables, personnel and other equipment for outbound either by rail, container or air. **There is no other such capability in the U.S.A.** The C-17 is the first cargo plane specifically designed to air-lift intermodal containers. We're ready.

- Aerospace spinoffs are exemplified first in two hometown industries, Intergraph and SCI, both Fortune 500 companies. Intergraph is the world's leader in computer aided design/work stations, employing over 4,000 with offices around the globe. SCI is a major supplier of sophisticated components to the Department of Defense and private industry sector. The hi-tech environment, educational opportunities at all levels, and the multi and intermodal transporation services have attracted a plethora of industries to the Valley, in particular the automotive industry. Chrysler's Acustar at the Jetplex Industrial Park; GM's Saginaw plant near Decatur and Athens; and GM's Saturn in Southern Tennessee are classics, with more to come.

The states west of Memphis and east of Atlanta will benefit from the route. AMC and NASA at Redstone Arsenal oversee a $7-$9 billion market each year. The hundreds of companies along the route comprise a substantial market. Arkansas, for instance, will be provided a direct access into the heart of this market area, into the heart of the Southeast and a direct route to Atlanta. Atlanta and the communities east of there already have strong ties with the market area described, they just don't have an efficient or safe highway system to reach them. The existing highway maze offers less than 10 miles of controlled or free access.

Our proposal is truly "a Highway of National and Strategic Defense Significance". Your authorizing the mileage to add this route is the only way it will ever be built. Insasmuch as most of it will be spread among 3 states - Alabama, Georiga and Mississippi, Tennessee being involved with less than 25 miles - it will not create a financial burden on any one state or on the Highway Trust Fund. Inclusion will allow, on the other hand, an early and expeditious completion of the project, defining the need for multi-state cooperation.

Mr. Chairman and members of this Subcommittee on Surface Transportation, we have patiently paid our tribute these past 35 years to the building of the Interstate System that we all are justly proud of. We got left out in 1956 for valid population reasons. That has reversed. We trust there is now more than ample justification for the legislation you report out to include the authorization of the necessary mileage for the construction of a highway built to interstate specifications from Memphis to Huntsville to Atlanta and from Huntsville to Chattanooga. As you know, there will not be another window like this for us for another 20 - 40 years.

We appreciate the privilege to appear before you to offer this testimony and be available to answer any questions you may have.

The following pages attached hereto are exhibits of support and information pertinent to this testimony.

Respectfully submitted,

Steve Hettinger

Steve Hettinger, Mayor
City of Huntsville, Alabama

# Bush signs bill providing funds for Yellow Creek plant

WASHINGTON (AP) — President Bush on Thursday signed a bill that includes $306 million to develop advanced solid rocket motors for the space shuttle at Yellow Creek, Miss.

The money for the Yellow Creek project was part of larger bill providing $67 billion for veterans, housing, environment, space and other programs for the fiscal year that began Oct. 1.

The bill provides $12.4 billion for NASA, $1.7 billion more than last year's level. Of the total, $1.8 billion would go to development of the planned space station, $250 million less than the Bush administration sought.

The bill calls for the federal government to assume the NASA facility's start up construction and development costs. The bill also provides for a total of $306 million, including $346 million for those costs in fiscal year 1990 and another $62 million carried over from fiscal year 1989.

Meanwhile, state economic development officials advise Mississippi to make quick decisions to benefit from production at the plant.

"What we have said all along is that we are on a very finite time line," Jay Moon of the state Department of Economic and Community Development said during a telephone interview.

"We indicated from the start that the projects had to be completed within an 18- to 24-month time period," Moon said. "We couldn't talk about projects that would be completed over a three- or four-year period. We want improvements in operation at a time at which plant site improvements are actually completed and families affiliated with the plant begin to move into the state."

Gov. Ray Mabus is expected to announce this month which public service entities will benefit from the $30 million in Mississippi Major Impact Economic Authority funds, for which some 65 proposals with a value in excess of $160 million were submitted.

While DECD officials have met with local officials on several occasions and have given Alcorn County's school districts a second opportunity to submit a more favorable proposal, Moon stressed that no binding decisions about allocating the $30 million have been made.

He added, however, that officials had discussed with the two school districts how consolidation into one might make possible "one large magnet school and possibly another school."

The magnet school concept is a key marketing tool state officials would like to use in luring to Mississippi homes families who might have unfavorable impressions of schools in the area. Some area officials fear workers at the facility may choose to live in Tennessee or Alabama.

# Lockheed is awarded $971 million contract

NASA has awarded a $971 million contract to Lockheed Missiles and Space Co. for 20 solid rocket motors, the main part of the shuttle's twin boosters.

Morton Thiokol, Inc., which produced the faulty booster rocket blamed for the 1986 Challenger disaster, did not bid on the contract, NASA spokesman Jerry Berg said Tuesday.

Under the new contract, the first set for shuttle installation is to be delivered in 1995. The motors, which provide most of the thrust during the first two minutes of flight, will be phased in over three years.

The new solid rocket motors will be produced at a yet-to-be-constructed plant at Yellow Creek, about 12 miles north of Iuka, Miss. The 125-feet-long motors will enable the shuttle to lift payloads six tons heavier than current cargos.

The $292 million production plant will be built over the next 3½ years, providing some 1,500 jobs. An additional $238 million will be spent on special equipment.

One of the 20 motors will be a test model, and seven will be used for ground test firing. The remaining 12 — one for each of the shuttle's two solid rocket boosters — will be targeted for actual launch.

Berg said the Challenger explosion increased the priority for production of the motors.

"There was some drive for doing this before Challenger, but it increased the priority for production of the motors," Berg said.

Challenger exploded 73 seconds after liftoff on Jan. 28, 1986, killing all seven astronauts. An investigation blamed a small leak in a joint between segments of one of Challenger's two booster rockets. Flames shot past two synthetic rubber O-rings and touched off the explosion of the huge fuel tank.

Following the explosion, the original solid rocket motor was redesigned to improve safety.

Preliminary work on the latest redesign project was launched in December 1989 under interim contracts between NASA and Lockheed.

Under an option for additional advanced solid rocket motors, worth up to $1.3 billion, NASA could order up to 88 motors.

Lockheed, based in Sunnyvale, Calif., is teamed with Aerojet Space Boosters Co. of Sacramento, Calif., as its principal subcontractor for development of the advanced motor, and with Rust International of Birmingham as the facility construction contractor.

Governor backs highway plan: Local/State, 1B

The Huntsville Times

# Hunt endorses new area interstate

MARIAN ACCARDI
...ies Staff Writer

Gov. Guy Hunt today pledged e support of his administration d the state Highway Department "do what we can" to make an terstate highway linking untsville with Memphis, Atlanta d Chattanooga a reality.

Such a system would help all the ities involved, Hunt said, "and will do all we possibly can."

nt made his comments today at gathering of North Alabama ayors, legislators and economic velopment officials.

"I don't know why we can't ve a high-tech corridor con-ting us east and west," Hunt d. "I'm proud to add our pport that we will do what we to encourage the Bush ad-inistration ... to be a part of s."

Huntsville Mayor Steve Het-ger said the country will embark a new national transportation n in 1991 and "North Alabama must play a significant part in the plan."

Mike Mercer/Huntsville Times

Hunt, left, speaks with Mayor Steve Hettinger during meeting here today with area mayors.

Hunt said he plans to meet with federal transportation officials, "letting them know early on about our feelings."

Asked when construction could begin on such a highway, Hunt said it could be possible in the next decade.

"The first thing to do is get people together," he said. "This is the first time I remember this many counties and cities" getting involved in a project.

The North Alabama Mayors Association presented Hunt a resolution it adopted last month supporting the interstate linking Huntsville with Chattanooga, Atlanta and Memphis and asking that he recommend to Congress and to the state governments of Georgia, Mississippi and Tennessee that the reauthorization of the Federal-aid Highway Act add enough mileage to the interstate highway system to build that route.

Buel Springer, the association's president and the mayor of St. Florian, said the interstate would enable the Tennessee Valley to become "one of the world's major economic corridors."

The Huntsville City Council has already approved a consulting agreement with Mitchell & Mitchel Inc. to promote the system.

State of Alabama

House of Representatives

MONTGOMERY, ALABAMA

# Resolution

HJR 467

By Representatives Butler, Drake, Lindsey, Hall, Burke, Hamilton, Moon, Starkey, Goodwin, Coburn, Carter, Britnell, Dillard, Marks, Parker, Grayson, Richardson, Freeman, Brooks, Sanderford, Logan and Rains

URGING THE PRESIDENT AND U. S. CONGRESS TO SUPPORT THE TENNESSEE VALLEY INTERSTATE HIGHWAY ECONOMIC DEVELOPMENT CORRIDOR

WHEREAS, the economic welfare, the opportunity and ability to compete in today's domestic and global markets, and the interstate and interregional needs now require that Huntsville and the communities of the great Tennessee Valley be served by an interstate highway system from Memphis to Huntsville to Atlanta and from Huntsville to Chattanooga; and

WHEREAS, the Memphis-Huntsville-Atlanta corridor not only satisfies a high priority for Huntsville and North Alabama, but also serves a need for a direct, non-circuitous interstate route for Atlanta and Memphis; along the corridor are several major Metropolitan Statistical Areas and some of the most highly productive rural areas in the United States; poultry, cotton and cattle being predominant; and

WHEREAS, flowing from Tennessee through Georgia, Alabama and Mississippi, the heavily utilized Tennessee River, with its direct access to deep water via the Tennessee-Tombigbee waterway and the 9000 miles of the Interconnected Inland Waterway System, is without interstate service except for a segment in Tennessee; the Huntsville-Chattanooga Corridor will allow an orderly extension of existing I-81 at Knoxville over I-75 to Chattanooga and then the corridor to Huntsville where it would connect with the Huntsville-Memphis-Atlanta corridor, providing an interstate highway interfacing with almost the total length of the Tennessee River - a necessity if the river and the region it serves is ever to approach its transportation potential; and

WHEREAS, the Alabama Legislature, along with the City of Huntsville welcomes and encourages the cities and counties of North Alabama and the States of Georgia, Mississippi and Tennessee and

*their affected communities to join in support of these objectives and move they be authorized by Congress in the reauthorization of the Federal-Aid Highway Act, with priority funding from the Federal Highway Trust Fund as administered by the Federal Highway Administration; now therefore*

*BE IT RESOLVED BY THE LEGISLATURE OF ALABAMA, BOTH HOUSES THEREOF CONCURRING, That we hereby urge President George Bush and the members of the U. S. Congress to take the necessary actions to fund the establishment and construction of the Tennessee Valley Interstate Highway Economic Development Corridor.*

*BE IT FURTHER RESOLVED, That a copy of this resolution be forwarded to the Federal Highway Administration, President George Bush and each member of the Alabama Congressional Delegation.*

*IN WITNESS WHEREOF, I have hereunto set my hand and have caused the GREAT SEAL of the State of Alabama to be affixed by the Secretary of State at the Capitol in the City of Montgomery on this the 18th day of April, 1990.*

# King backs Memphis-to-Atlanta interstate

The Associated Press

FLORENCE — A proposed interstate between Memphis and Atlanta, long sought by officials across north Alabama, is getting a letter of support from the state highway director.

State Highway Director Royce King said he would send a letter this week to federal Highway Administrator Thomas Larson indicating the state's support for the highway.

The proposed highway likely would bring the 500-mile interstate through the Muscle Shoals area, which is served by U.S. 72 as its primary east-west route.

Florence Mayor Eddie Frost said his city has already contributed $4,600 to cover highway consulting fees, following an initial payment of $75,000 by Huntsville.

Federal funding remains a major hurdle. Seven mayors from north Alabama met in Montgomery on Wednesday with Gov. Guy Hunt and King, who both pledged support.

Frost said similar commitments are being sought from governors and highway directors in Mississippi and Georgia, and discussions are also being held with officials in Tennessee.

The proposed interstate is expected to provide a vital link for high-technology industry that is being developed throughout north Alabama, particularly NASA's advanced solid rocket motor plant being built near Iuka, Miss.

The next step will be to include the project in next year's federal Highway Act. Congress will consider the act this year, and money from the Federal Highway Trust Fund would become available after October 1991.

Construction on the interstate has been estimated to take 10 years to complete.

Members of the North Alabama Mayors Association campaigned for the project in Washington last month.

"We think that when we get all the states to sign off on it, we'll be able to get it included on the bill," Frost said.

Members of Alabama's congressional delegation introduced legislation in both chambers last August urging that the new Memphis-to-Atlanta interstate be included in the 1991 Highway Act.

State of Tennessee

NED McWHERTER
GOVERNOR

September 24, 1990

The Honorable John Paul Hammerschmidt
Committee on Public Works and Transportation
2110 Rayburn House Building
Washington, D.C. 20515-0403

Dear Congressman Hammerschmidt:

As Governor of Tennessee, I would like to express my appreciation for your willingness to examine the feasibility of constructing a new segment of interstate highway that might serve to assist the economic development of Arkansas, Mississippi, Alabama, Georgia and Tennessee.

Currently in Tennessee we are in the midst of the most aggressive road construction program in our State's history. A major priority of this road program is the widening of Highway 64 that connects Memphis and Chattanooga. I chose to undertake this project as a means of improving the distribution network of several rural counties. This commitment already has resulted in the location of several new industries to an area that historically has suffered in high unemployment.

The same reasons support the consideration of a new interstate segment that could further enhance the economic competitiveness of our region. As your Committee examines this proposal, I will be glad to offer any assistance needed in support of this project.

Again, I appreciate your interest in the progress of our region.

Sincerely,

Ned McWherter

Dear Mr. Mitchell:

Thanks for your letter of May 7. I enjoyed visiting with your group. You have a bold, adventurous project. I believe you can make it work.

It is especially to the advantage of Mississippi and Alabama that this corrider be developed. Tennessee is deeply grateful that you are willing for a portion of it to go to our state. As I said in the meeting, this must come from Washington.

I don't know how much influence the Lieutenant Governor can have in this regard. I do think that the Governor and the Department of Transportation in the State of Tennessee must be involved. I stand ready to cooperate with you fully.

With kindest regards, I am

Yours very truly,

John S. Wilder

**STATE OF MISSISSIPPI**

OFFICE OF THE GOVERNOR
RAY MABUS
GOVERNOR

October 5, 1990

Honorable Norman Mineta
Chairman, Subcommittee of House Public Works
and Transportation Committee
Fort Smith, Arkansas

Dear Congressman Mineta:

The purpose of this letter is to restate my support for the proposed Tennessee Valley Interstate Highway connecting two of the South's largest and fastest growing metropolitan communities: Atlanta and Memphis. We believe that the proposed corridor would significantly enhance the future growth potential of Northwest Georgia, North Alabama, Northeast Mississippi, and Southwest Tennessee.

From our State's prospective, Northeast Mississippi represents one of the fastest growing commercial regions in Mississippi and the Deep South. Northeast Mississippi has become the upholstered furniture capital of the world and is home to some of the largest manufacturing and industrial companies. Northeast Mississippi was recently selected for the location of the new NASA Advanced Solid Rocket Motor plant to be constructed near Iuka, Mississippi, virtually along the route of the proposed interstate. The addition of this new facility will create a space research and development corridor linking Huntsville to Iuka.

I believe that the proposed interstate will enhance the existing and future economic vitality of the area traversed by the highway, and I strongly encourage your consideration of this effort. If I may provide any additional information please contact me at your convenience.

Sincerely,

RAY MABUS
Governor

Mr. J. E. Mitchell, Jr.
President
Mitchell & Mitchell, Inc.
P. O. Box 524
Huntsville, Alabama 35804

Dear Mr. Mitchell:

It was indeed a pleasure to meet with you, May Hettinger, and the other members of the delegation from Huntsville. There is no question that transportation has been a key in the evolutionary process of Memphis becoming the distribution center of Mid-America.

I commend you for your foresight in identifying the corridor between Atlanta and Memphis, linking the three MSA's in north Alabama and thus providing more impetus to the economic growth of the entire corridor. I have asked our transportation planners to carefully monitor the work you are doing and am hopeful of the opportunity in the near future to more tangibly express my support for this interstate transportation link.

I hope you will continue to keep me informed as you proceed with your plans to work with our elected representatives in the Congress of the United States, and as opportunities arise for involvement by myself and others in the Memphis area.

Sincerely,

Dick Hackett

Richard C. Hackett

RESOLUTION

WHEREAS, North Alabama is headquarters for the Army Missile Command at Redstone Arsenal where the Space Defense Initiative and other Army sophisticated missile weapons systems are conceived, designed, contracted for, deployed and maintained; home for NASA's Marshall Space Flight Center where our country's exploration into space began and continues; where several Fortune 500 hi-tech companies have been spawned; where all major aerospace firms have substantial facilities and personnel; and where eductional and cultural activities abound; and

WHEREAS, economic growth has extended east and west along the banks of the Tennessee River, the Valley's first transportation system, supporting such industrial giants as Monsanto, Amoco, Champion Paper, Wolverine Tube, 3M, General Motors' Saginaw Division, Reynolds Aluminum, Chrysler's Acustar, GE, Fruehauf, and others; and

WHEREAS, the national defense, federal, state and local governments and the public convenience and necessity now require the communities of North Alabama and the Tennessee Valley be served by the National Defense Highway Transportation System (Interstate Highway System) connecting Huntsville, Alabama with Memphis, Tennessee, Atlanta, Georgia and Chattanooga, Tennessee in order to meet interstate and inter-regional highway travel needs:

NOW, THEREFORE, BE IT RESOLVED that the North Alabama Mayors Association advocate and support the development of an interstate highway from Memphis to Huntsville to Atlanta and from Huntsville to Chattanooga.

ADOPTED this 20th day of January, 1989.

ATTEST:

Sue Broome

SUE BROOME, CLERK

RESOLUTION NO. 90-1

A RESOLUTION PROMULGATING THE PURSUIT OF AN INTERSTATE HIGHWAY SYSTEM CONNECTING HUNTSVILLE AND MEMPHIS WITH ATLANTA AND CHATTANOOGA.

WHEREAS, The Top of Alabama Regional Council of Governments is deeply involved with economic and job development for the people of Limestone, Madison, Jackson, Marshall and DeKalb Counties; and,

WHEREAS, Business and industry require access to modern four-lane roads with limited or controlled access as a condition to initially locating or expanding their job-creating enterprises; and,

WHEREAS, The National Interstate and Defense Highway system was not initially designed to serve Huntsville because it did not meet the criteria of having 50,000 or more people and/or the presence of a major military installation; and,

WHEREAS, The City of Huntsville now has a population estimated to be approximately 200,000 in population and Redstone Arsenal together with the Marshall Space Flight Center of the National Aeronautics and Space Administration - thereby making Huntsville eligible under two separate criteria for Interstate service; and,

WHEREAS, The Interstate Highway system is due for completion in 1991 and it is appropriate that an extension of this road system be developed for the future;

NOW, THEREFORE, BE IT RESOLVED by the Top of Alabama Regional Council of Governments that it endorses the following:

1. That an Interstate Highway be developed along a corridor from Memphis, Tennessee through Huntsville, Alabama to Atlanta, Georgia.

2. That the above proposed Interstate Highway System be accomplished in part, by upgrading to Interstate standards the Appalachian Development Highways designated as Corridor "W" leading in a sourtherly direction from Memphis to its intersection with Corridor "V"; and similiarly upgrading Corridor "V" to interstate standards in its entirety leading from its intersection with Corridor "W" in an easterly direction through Huntsville to the termination of Corridor "V" at Interstate 20 near South Pittsburgh, Tennessee.

3. That the Interstate Highway System corridor proposed in paragraph 1. above join Huntsville directly with Atlanta.

BE IT FURTHER RESOLVED that the Top of Alabama Regional Council of Governments hereby modifies any of its plans as may be necessary to reflect the above objectives.

ADOPTED this 25th day of January, 1990.

RESOLUTION

WHEREAS, the Northwest Alabama Council of Local Governments is made up of the five counties of Colbert, Franklin, Lauderdale, Marion and Winston and the municipalities therein, and;

WHEREAS, the NACOLG Board of Directors is made up of the chief-elected officials of each of these counties and municipalities, and;

WHEREAS, it is the primary purpose of the Northwest Alabama Council of Local Governments and its Board of Directors to gain or retain the services which would be most beneficial to the region as a whole, and;

WHEREAS, it has been determined that Northwest Alabama would benefit greatly from the development of interstate highways connecting Northwest Alabama with Memphis, Atlanta and Chattanooga which would meet the interstate and inter-regional highway travel needs of the Tennessee Valley.

NOW, THEREFORE BE IT RESOLVED that the Northwest Alabama Council of Local Governments Board of Directors does hereby endorse and support the development of these interstate highways.

APPROVED AND ADOPTED this 27th day of July, 1989.

Mr. J. E. Mitchell, Jr.
Project Coordinator
Mitchell & Mitchell, inc.
P.O. Box 524
Huntsville, Alabama 35804

Dear Ed:

I appreciate your January 7 letter pertaining to the Memphis-Huntsville-Atlanta interstate project.

We believe that the proposed route would be an asset to the Tennessee River Valley and will greatly improve access to the potential industrial, commercial, and other development along this 200-mile reach of the Tennessee River. We like the concept and are willing to work with appropriate entities as the project progresses in addressing specific TVA interests.

Hope to see you again soon.

Sincerely,

John B. Waters

Mr. J. E. Mitchell, Jr., President
MITCHELL & MITCHELL, INC.
P. O. Box 524
116 Holmes Avenue, N. E.
Huntsville, AL 35804

Dear Ed,

I appreciate receiving your letter of May 16, announcing your involvement in securing authorization of a new interstate highway connecting Huntsville with Memphis and Atlanta.

We are on the same wave length. I am also very interested in making sure this region begins the necessary preparations to influence any Congressional legislation that develops from the reauthorization of the Interstate Highway Act in 1991. The 1989 Tennessee-Tombigbee Development Opportunities Conference at which you spoke last year will include a presentation by Mr. Norman Wuesterfeld, Executive Vice-President of Wilbur Smith Associates of New Haven, Connecticut on "Expansion of the Interstate and Toll Road Systems."

Without doubt the greatest deterrent to continued industrial development of the so-called Tenn-Tom region is the lack of a modern highway system. You may be assured that the Authority fully supports any action that will lead to improvements of our land transportation system.

Please let me know whenever we can be of any assistance to you and your efforts in this regard.

Sincerely,

Donald G. Waldon
Administrator

Mrs. Jan Jones

**Resolution in Support of the
Development of the Tennessee Valley
Interstate Highway Economic Development Corridor**

WHEREAS, the hospitality and travel industry of North Alabama and the South now requires the communities of North Alabama be served by an interstate highway connecting Huntsville, Alabama; with Memphis, Tennessee; Atlanta, Georgia; and Chattanooga, Tennessee in order to fulfill the public convenience needs of the intrastate, inter-regional and interstate traveler; and

WHEREAS, the Alabama Mountain Lakes Association desires to maximize the economic and social impacts of the hospitality and travel industry in Northern Alabama as a means of furthering the general welfare of our citizens by increasing the number of people who travel into our region and extending the length of their stay here; and

WHEREAS, the numerous travel attractions, recreational amenities and lodging and meeting facilities of North Alabama would be a more convenient location for business meetings and conventions as well as an attractive source of heritage, recreation, education and relaxation for the populas to the east and west;

THEREFORE, Be It Resolved, that the Alabama Mountain Lakes Association advocates and supports the development of the Tennessee Valley Interstate Highway Economic Development Corridor with the proposed route through North Alabama.

ADOPTED this 25th day of April, 1990.

on behalf of

The Arkansas Chapter of

The Associated General Contractors of America

---

Presented to the

Field Hearing on the Reauthorization of the

Federal Surface Transportation Assistance Act

---

on the Topic of Reauthorization of

The Nation's Surface Transportation Programs

April 22, 1991

Fort Smith, Arkansas

Mr. Chairman, Ladies and Gentlemen. I am Ben M. Hogan, a contractor from Little Rock, Arkansas. Today I represent the Arkansas Chapter of the Associated General Contractors of America and also the National Office of the Associated General Contractors of America. I have served as President of the Arkansas Chapter and am currently serving on the Highway Committee, which I chaired for thirteen years. At the national level, I was President and also chaired for three years on the Joint Committee with ASSHTO, ARTBA, and AGC, and am still a member of the Executive Committee of the Joint Committee. The Arkansas Chapter has 94 contractor members and 201 affiliated members engaged in the contracting business of Arkansas. The remainder is performed primarily by out-of state contractors who are mostly members of other AGC chapters. AGC is a National Trade Association of more than 32,500 firms, including 8,000 of America's leading general contracting firms. They are engaged in the construction of the nation's commercial buildings, shopping centers, factories, warehouses, highways, bridges, tunnels, airports, water works facilities, dams, water conservative projects, defense facilities, multi-family housing projects, and site preparation/utilities installation for housing development.

AGC appreciates the opportunity to express its views on issues facing the nation in surface transportation. AGC believes this nation must increase investment in its surface transportation infrastructure to provide the foundation for continued economic prosperity and international competitiveness.

AGC is also concerned that this country is in a recession and that steps must be taken immediately to stimulate the nation's economy and create jobs.

The construction industry lost 498,000 jobs in the ten month period from May, 1990 to March, 1991, and construction unemployment rose from 13.0 percent in February, 1990 to over 21 percent in February of 1991. This compares with a total U.S. unemployment rate of 5.8 percent in February, 1990 and 7.2 percent in February, 1991.

Clearly, this is a critical problem that needs to be addressed. AGC believes the reauthorization of the nation's surface transportation programs can play a significant role in bringing the nation out of the recession and provide the long term framework to promote needed investment in our nation's transportation infrastructure.

With the nation in a recession, AGC believes the economic benefits of infrastructure investment are particularly worthy of note. Unlike many government expenditures, infracture spending is an investment which has short and long term benefits.

The short term benefits of infrastructure investment are increased construction employment and the ripple effect of induced economic activity in other industries that follows. The U.S. Department of Commerce estimates:

> . Each additional $1 billion spent on new construction creates 46,800 jobs in construction, supply and service industries. A $25 billion highway program sustains nearly 1.2 million jobs.
>
> . Each $1 billion spent on new construction in the United States generates $3.62 billion in economic activity across all industries and services. A $25 billion highway program generates $90.5 billion in economic activity throughout the country.

These statistics show that at a time when construction industry unemployment looms at over 21 percent, and unemployed construction workers account for 14 percent of the nation's unemployed, increased spending for the nation's surface transportation programs couldn't be more critical.

The long term benefits of infrastructure investment have also been well documented over the past several years. The research of Dr. David Aschauer has established a critical link between infrastructure investment and productivity by comparing the infrastructure investment levels of the major industrialized nations and their productivity. Based on Dr. Aschauer's research, this nation needs to invest more in infrastructure to maintain productivity and global competitiveness now and in the future.

As the 102nd Congress gets underway, we applaud this Subcommittee for scheduling these hearings and getting on with the important task of reauthorizing the nation's highway and mass transit programs. AGC is also very encouraged that President Bush and Transportation Secretary Skinner have placed transportation as a top priority of the Administrations's domestic agenda.

We commend you Mr. Chairman, and the leadership of the House Public Works and Transportation Committee for taking the initiative earlier this year to propose an aggressive, 5 year, $153 billion, budgetary framework for the future funding of our nation's surface transportation programs.

AGC believes the Committee budget request is on the right track to improve and expand the efficiency of our nation's highway and bridges and make a substantial federal commitment towards addressing documented annual highway capital needs of all levels of government of $58.5 billion. It can also make a critical difference in the state of the U.S. economy, now and in the future.

Therefore, at our recent Convention, AGC unanimously adopted a Convention resolution in support of the House Public Works Committee's budget proposal. Consistent with our policy to increase highway investment, AGC will continue to:

1. Urge a draw down in the trust fund balance;
2. Support a recapturing of the 2 1/2 cent gas tax lost to the general fund last year; and
3. Support an increase in the gas tax to address unmet highway needs.

The Committee can count on our continued support and cooperation as you develop the details of the Committee's reauthorization proposal.

In preparation for the reauthorization of the Federal Surface Transportation Programs in 1991, AGC undertook a policy development initiative in 1988 which is ongoing. Recognizing that construction of the interstate highway system will be essentially complete in the early 1990's, America is at a crossroads with regard to its future transportation policy. AGC's policy development effort has focused on those surface transportation issues which will continue to be important to the nation into the 21st century.

Following is a discussion of some of the major policy recommendations which AGC has adopted to guide our efforts in working with the Administration and the Congress to develop new surface transportation legislation.

## TRANSPORTATION'S ROLE IN ECONOMIC DEVELOPMENT

AGC believes that transportation infrastructure is at the very heart of what makes this country thrive and prosper. Over the past 30 years the gross national product of this country has grown over 1,000 percent, nearly double the increase of the previous 30 year period in our history. Several factors account for this growth.

One factor, highway development stands out above all others. America has grown and prospered from the mobility provided by the nation's highway transportation system, in general, and specifically the Interstate Highway System, which was started in 1956. A look at the role of our highway system in our economy will show the magnitude of its effect on current and future economic development.

- 89.5 percent of all personal travel is on highways;
- 82 percent of all freight revenues are carried on highways; nearly every product manufactured or consumed in this country is, for a portion of its journey from production to market, carried by truck; and
- 85 percent of America's workers commute to work by private vehicle.

Clearly, highways play a vital role in our economy. No commercial, industrial, retail, or residential development would have been built in a location that did not provide for an adequate highway system to support it.

As development patterns have changed, highways have played an even more important role in this country. Development over the past 20 years has shifted substantially to suburban growth centers. Suburban employment currently accounts for 50 percent of metropolitan jobs, 47 percent of all job destinations, and 67 percent of all job growth in this country. America is increasingly working in commercial buildings, industrial complexes, and shopping centers in suburban areas. None of these suburban developments would have been possible without an adequate highway transportation system serving them.

Increasingly, communities around this country are recognizing the critical link between highways and economic development. Phoenix has undertaken a multibillion dollar road development program designed to support the area's rapid economic development. A critical factor in the tremendous growth in the suburban Washington, D.C. area of Fairfax County, Virginia, has been access to highway transportation. This same link between highways and building is being played out in growth areas across the country.

Unfortunately, some tend to take our highway system for granted. Indeed, like other aspects of our nation's infrastructure, some rarely acknowledge the vital role that highways play in their daily lives, until the highway system breaks down.

There are already signs that our highway system is wearing out. The tremendous highway investment made over the past 35 years has been a great success. Our highway network has carried traffic far beyond its design life, as Americans have enjoyed the rewards of mobility unknown to most of the rest of the world. This success, however, has taken its toll as we fail to adequately reinvest in our highway system. Many portions of the Interstate systems are in need of repair and reconstruction; nearly 50 percent of the nation's bridges are structurally deficient or obsolete; and congestion on urban freeways is increasing at an alarming rate.

A central question facing the Congress is how to ensure adequate investment in the nation's transportation infrastructure to meet current and future demands for economic growth. AGC believes that this nation is seriously underinvesting in its transportation infrastructure, at a great cost to the nation in lost productivity, jobs, and international competitiveness. The nation's transportation system is the arterial system by which the country, both public officials and private citizens alike, continue to ignore the construction and rehabilitation of this nation's highways and the congestion in the nation's airports and airways, our nation will pay many times over in lost economic opportunity now and in the future.

AGC is joined by a number of others in a concern for the state of the nation's infrastructure. There is clear and convincing evidence that our abysmally deficient investment in infrastructure is having a negative effect on the future of the

nation's economy. The National Council on Public Works Improvement (NCPWI) identified the current lack of infrastructure investment as an issue approaching crisis proportions. In its final report entitled "Fragile Foundations", the NCPWI concluded that the quality of America's infrastructure is barely adequate to fulfill current requirements and insufficient to meet the demands of the future. A major recommendation contained in the NCPWI final report is a call for a national commitment, shared by all levels of government and the private sector, to increase capital spending for infrastructure by as much as 100 percent above current levels.

The Rebuild America Coalition, an organization of 64 public and private associations dedicated to infrastructure investment, published a study in March of 1988 entitled "Increasing Infrastructure Investment: Making America's Economy Competitive Again". That study examined the historic role of infrastructure investment in promoting economic growth and the adverse economic effects of the disinvestment in infrastructure which has taken place over the past 20 years.

A strong link between public works investment and America's productivity and international competitiveness has been drawn by economist Dr. David Aschauer, formerly with the Chicago Federal Reserve Bank. In his research, Dr. Aschauer studied the productivity and public investment levels of seven major industrialized nations -- the United States, Japan, West Germany, Canada France, Italy, and the United Kingdom.

The results of Aschauer's research indicate that nations with the highest savings and investment also have the highest productivity. He concludes that "Public investment, by directly raising productivity as well as by promoting private investment, works doubly hard in enhancing our worldwide competitive position". Last year, 227 economists, including six Nobel Laureates, called upon the Congress and the President to increase public investment noting the crucial link between that investment and the productivity needed for a competitive edge.

In as much as transportation is a major component of the nation's infrastructure, AGC believes that the NCPWI findings and the research work of the Rebuild America Coalition and Dr. Aschauer lend strong support to our advocacy of increased transportation capital investment to keep America's economy strong.

AGC RECOMMENDATION:

AGC urges the federal government to assume the necessary leadership role to promote adequate transportation capital investment by all levels of government.

## SURFACE TRANSPORTATION NEEDS AND FUTURE FUNDING

Statistics show that U.S. spending on public works projects has declined significantly as a percentage of total governmental expenditures. In 1950, 19.1 percent of government expenditures went to public works, by 1984, the figure dropped to 6.3 percent. This comes at a time that U.S. motorists experienced over 700 million hours of delay on highways -- wasting nearly 3 billion gallons of gasoline as a result. The projected congestion of 3.9 billion hours of delay by 2005 is staggering.

The most in-depth analysis of highway needs was performed in 1988 by the American Association of State Highway and Transportation Officials (AASHTO). In their report entitled "The Bottom Line" -- A summary of the Surface Transportation Investment Requirements 1988-2020", AASHTO identified annual highway capital investment needs, by all levels of government, of up to $58.6 billion between now and the year 2020. This compares with highway capital spending in 1987 of only $31 billion.

With respect to mass transit needs, AASHTO's Bottom Line report identified annual capital investment requirements of up to $3.4 billion. Currently, capital investment in transit is just over $2.1 billion annually.

AGC RECOMMENDATION:

AGC applauds the work of AASHTO as part of the Transportation 2020 program and encourages the Subcommittee to consider AASHTO's needs assessment in addressing future surface transportation funding.

## THE CURRENT PROGRAM -- MODEL CONCEPTS FOR THE FUTURE

The challenges facing this country in transportation are immense but not insurmountable. The federal programs support-

ing the nations's surface transportation are basically sound providing a solid framework to address the challenges of the future. As the Subcommittee considers the future surface transportation legislation, AGC believes there are a number of important concepts of the current program which are critical to the success of surface transportation programs in the future. They include:

. User Fee - Trust Fund Concepts - The critical element which has led to the success of the Federal-aid highway program is the user fee financed trust fund mechanism which is used to support them. The trust fund concept has long been recognized as a reliable and stable financing mechanism for infrastructure investment. As early as the 1920's, several states had developed dedicated, user-fee mechanisms to support highway improvement programs in their states.

By 1956, the year the Interstate Highway Program was initiated, some 25 states had instituted trust funds or similar dedicated funding sources for their highway programs. Using these successes as a model, the Interstate Highway Program was developed around the user-fee trust fund concept. That financing mechanism has served this country well for nearly 35 years, supporting the nation's highway program and the development of the world's greatest public works project -- the Interstate Highway System.

Several key features of the trust fund are largely responsible for its success. First, it is user-fee financed -- the nation's highway transportation system is paid for only by the user. The more you use the system the more you pay. The public support for the highway program has remained strong primarily because the traveling public receives a direct benefit from the money it pays in user fees.

Another key aspect of the trust fund is that it provides a stable and reliable financing mechanism on which a successful major capital investment program must depend. A typical highway project may take 7 to 10 years from the planning stage to completion. Proper planning for the transportation needs of the future requires that a dependable source of revenue will be available to finance the needed improvements when they are ready for construction. The multi-year authorization process and contract authority are critical ingredients to permit for this long term planning and assure the highway program's success.

From the budgetary standpoint, perhaps the most critical feature of the trust fund is the Byrd Amendment which assures its solvency. The amendment provides that on an annual basis, there is a determination of the outstanding obligations and current balance and expected receipts of the trust fund. This information is used to guarantee that future commitments against the trust fund can be honored.

**AGC RECOMMENDATION**

AGC recommends the Congress continue the concept of a user fee financed trust fund to support the nations's Federal-aid highway program.

- Maintain the Gas Tax for Transportation Purposes: - AGC strongly opposes any diversion of fuel taxes to purposes other than transportation. As discussed previously the transportation needs of this country are so great, that we cannot afford to divert this revenue source to other government spending. AGC supports an increase in the gas tax if it is dedicated solely to improving the nation's highways and bridges. AGC believes that the 2.5 cents now going to the general fund for deficit reduction should be placed in the Highway Trust Fund and used for needed highway and bridge improvements.

In a related issue, AGC believes the Congress should eliminate the fuel tax exemption for gasohol. Purchasers of gasohol, like other highway users, should pay their fair share of the costs of construction and rehabilitation of the nation's highway system. However since gasohol users pay only one-third of the normal 14 cent per gallon gas tax, they are being subsidized by other highway users. Last year, the gasohol subsidy cost the Highway Trust Fund nearly $500 million.

AGC believes that energy independence and clean air are worthy goals, but not at the expense of the nation's highway program. If the gasohol industry truly needs a tax incentive to compete in the marketplace, then other subsidies should be considered by the Congress. The entire nation will benefit from cleaner air and energy independence therefore, AGC believes the general taxpayer, not the na-

tion's highway program, should bear the responsibility to subsidize the gasohol industry.

**AGC RECOMMENDATION**

AGC strongly urges the Congress to reject any further proposal to increase the gasoline tax for deficit reduction or non-transportation spending. AGC further urges the Congress to place the 2.5 cents now going to the general fund for deficit reduction in the Highway Trust Fund to be used for much needed highway and bridge improvements. AGC supports Congressional efforts to increase funding for the nation's highway program through spending down the trust fund balance, increasing highway user fees, and elimination of the tax exemption for gasohol.

. The Open Competitive Bidding System - The open competitive bidding system has long been the cornerstone of the effective administration of public funds in construction contracts. The nation's highway system, as exemplified by the Interstate system, is an outstanding example of the success of this bidding system. Across this nation, the traveling public utilizes a highway system that was built to quality standards and the public has been assured, through open competition with award to lowest responsive and responsible bidder, that they were obtaining this quality product at the lowest cost to the taxpayer.

AGC believes that the open competitive bidding system remains the single most effective means of contracting for highway construction. In instances where concerns about contractor performance arise, there currently exists a number of steps which can be used by State transportation officials to assure a quality project. These steps include:

1. Prequalification;
2. Improved Plans and Specifications;
3. Prebid Conferences;
4. Adequate Inspection; and
5. Preconstruction Conferences

AGC believes these steps, in conjunction with open competitive bidding, assures the taxpaying public of the highest quality project at the lowest possible price and the construction contractor of fairness and integrity in the selection process.

AGC RECOMMENDATION

AGC strongly urges continuation of the time-tested, open competitive bidding system -- with contracts publicly advertised, bids publicly received and read aloud, and contracts awarded to the lowest responsive and responsible bidder -- as the means of contracting for federally-assisted highway construction.

. Equitable Distribution of Funding - AGC recognizes that one of the most difficult challenges of developing future highway legislation will be devising equitable formulas for the distribution of funding. While the current formulas may not be viewed by all states as equitable, AGC believes that two concepts contained in the current program assure all states a certain level of equity. They are the one-half percent minimum apportionment and the 85 percent minimum allocation provisions.

AGC acknowledges that these provisions may have to take a different form in the future program since certain categories of funding are likely to be revised. However, AGC endorses the overall concept of guaranteeing small and rural sates a minimum level of total federal funding to support their highway programs. AGC equally endorses the concept of guaranteeing a minimum level of return of trust fund contributions to states which, through the formula process, receive significantly less in apportionments than they contribute in user fees.

AGC RECOMMENDATION

AGC recommends a continuation, in future legislation, of the concepts of a guaranteed level of federal funding to small and rural states, as well as a guaranteed minimum return of trust fund revenues to donor states which contribute significantly more in user fees than they receive in apportionments.

CURRENT PROBLEMS -- A LOSS OF PROGRAM EFFECTIVENESS

While the current program has generally worked well, there are a number of policies which are having an adverse effect on the overall program effectiveness. The most damaging policies are occurring as part of the budget process which prevents the

timely expenditure of highway user revenues for their intended purpose. No less troublesome, however, are several other aspects of the program which compromise the cost effectiveness of the program. The problem areas include:

. Budgetary Treatment of the Transportation Trust Funds

While the trust fund mechanism has worked well in funding transportation programs, the current budget process inhibits the expenditure of the trust fund receipts for their intended purpose. AGC views the trust fund and the highway program in the context of an ongoing capital investment program which should be subject to different rules than the current budget allows. AGC believes the manner in which the transportation trust funds are treated in the budget process needs to be modified.

As mentioned previously, the highway program is founded on the basis of multi-year authorizations for highway investment. The process recognizes that when a highway project is approved and let for contract, it may be 3 or more years before the final reimbursement for the project will be made to a state and the construction contractor paid in full for the work. For this reason, the user fees paid into the Highway Trust Fund are kept in force for 3 years beyond the final authorization in any highway legislation. This provides the necessary financing for the project at the time the bills need to be paid. Without other artificial spending restraints such as obligation ceilings, the trust fund can support the highway program with a relatively low cash balance of approximately $2 to $3 billion.

The budget problems which have faced this country since the late 1960's, however, have had a detrimental effect on the ability of the federal government to let the trust fund work in the manner in which it was intended. Since 1969, artificial spending restraints have caused the Highway Trust Fund balance to grow dramatically to a current balance of over $15 billion including the mass transit account.

A first step in addressing this issue would be to expend the trust fund balances for their intended purposes. Since the trust fund receipts can be used for no other purpose than transportation, bankrolling these trust funds is not only a breach of faith with the transportation users of this country, but is merely postponing work that should be done

now to prevent more costly repairs later. A longer term solution to this issue is to take the trust funds out of the unified budget. These programs have not contributed to the deficit. The large cash balances are the very proof of that. The user-fee financed transportation programs of this country should be funded at the level their trust funds can support. The receipts should not be loaned to other programs while vital transportation needs of this country are neglected.

AGC RECOMMENDATION

AGC continues to endorse the House Public Works and Transportation Committee's initiatives to take the transportation trust funds out of the unified budget process.

. Special Preference Programs - In conjunction with AGC concerns about preservation of the open competitive bidding system, AGC has an ongoing concern with the continuation of special preference programs within DOT's federally assisted construction programs. Beginning with the Department of Transportation's 1980 Minority Business Enterprise regulations and continuing with the statutory requirements for Disadvantaged Business Enterprise (DBE) participation in the highway, transit, and airport improvements programs which were enacted in 1982 and 1987, AGC is very concerned that the Department's DBE programs are compromising the competitive bidding system.

Although the notion exists that the apparent lack of minority-owned construction firms proves there has been discrimination in the award of public construction contracts AGC believes that the open competitive bidding system by its nature, is race and gender blind. If construction contracts are publicly advertised, bids accepted from all qualified bidders and read aloud publicly, there is no chance that a public agency can discriminate in the award of their contracts.

AGC therefore questions why general contractors should be subjected to requirements that force them to engage in another kind of discrimination which denies individuals subcontracts because they are not a member of a preferred disadvantaged group.

AGC RECOMMENDATION

AGC urges the Congress to sunset the current DBE program which results in the denial of subcontracts to many individuals because of their race, gender, or national origin. Instead, the Congress should explore means of promoting the participation of disadvantaged business enterprises in the Federal-aid highway program that will not be subject to constitutional challenge.

- Highway Program Funding System - Over the past several decades, the highway program has been used as leverage to force compliance with other federal mandates. From highway beautification to clean air, there are currently at least 11 different highway program sanctions ranging from withholding project approval to withholding of highway apportionments which may be imposed. Given the pressing need to adequately fund our nation's highway program, it is counterproductive, at best, to impose highway sanctions on states and jeopardize their ability to meet growing highway needs.

AGC RECOMMENDATION

AGC recommends that the Congress remove the current sanctions and penalties affecting the highway program and explore alternate means to achieve appropriate state compliance.

- Federal/State Roles - As other major changes in the program are considered, it is an opportune time to reassess the current federal/state/local roles in the nation's highway program. AGC believes that the federal/state partnership that has existed in the highway program has generally worked well. AGC believes, however, that a refinement of the federal and state roles should be examined as follows: There is a legitimate role for the federal government to establish national priorities and conduct oversight of federal expenditures. However, AGC believes there has been too much federal intrusion into state decision making and the administration of the highway program.

AGC RECOMMENDATION

AGC recommends the Congress consider a reduced federal role in highway program administration, particularly with respect to project by project decision making, and endorse increased flexibility in program administration by the states.

Funding Flexibility between Highway and Transit Programs

In a related issue AGC is concerned by the provisions in the Administration's bill which would provide state and local governments the flexibility to transfer funding between the highway and transit programs.

AGC continues to believe that revenues placed in the Highway Account of the trust fund must be expended solely for highway improvements. Current revenues are insufficient to meet documented highway needs; allowing the transfer of funds to mass transit projects further exacerbates an already critical funding problem.

AGC RECOMMENDATION

AGC recommends that the Congress reject proposals to provide funding transferability between highway and transit programs to state and local governments.

In closing, AGC acknowledges that the Congress faces a tremendous challenge in balancing interests in the future legislation and stands ready to work with the Congress as it develops solutions to the nation's transportation infrastructure crises.

STATEMENT BY

KEITH JONES

EXECUTIVE DIRECTOR

CENTRAL ARKANSAS TRANSIT AUTHORITY

BEFORE THE

SURFACE TRANSPORTATION SUBCOMMITTEE

OF THE

HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

REGIONAL HEARING ON THE REAUTHORIZATION OF
FEDERAL HIGHWAY AND MASS TRANSIT PROGRAMS

FT. SMITH, ARKANSAS
APRIL 22, 1991

Mr. Chairman,

My name is Keith Jones and I am the Executive Director of the Central Arkansas Transit Authority (CATA). CATA provides public bus service to the Little Rock-North Little Rock urbanized area. We operate 50 peak hour buses on 31 routes. CATA served over 3.2 million passenger trips in 1990, with an operating budget of $4.5 million. On behalf of those riders I am grateful for this opportunity to speak to you and the members of the Subcommittee.

CATA is a member of the American Public Transit Association (APTA) and the South West Transit Association (SWTA). Both organizations have provided testimony to this Subcommittee on the reauthorization bill. While my comments will in some part echo the consensus positions of our public interest groups, I hope to present viewpoints typical of a small-to-medium sized transit system. My fellow panelists are more than competent representatives for the rural and statewide transit networks.

Before we get further into the numbers and the dollars, it is important to note that transit systems provide a very personal service. We take people to work, to school and training, to the doctor, and to shopping centers and grocery stores. The vast majority of our riders have no car available for their travel needs. For many, their life must revolve around where the bus can take them, and when. In our city, that means they must have their travel complete by 6:30 in the evening, and they don't travel at all on Sundays or major holidays. They can only go where they can walk to and from a bus route. I just found an example this week of a man who walks two and one-half miles to an express bus line every day.

Housing choices are limited by where the bus goes.

The reauthorization bill you are addressing must re-evaluate the Federal role in public transportation. From where we sit, that role has been shrinking steadily for ten years. In 1981, the Section 9 appropriation for CATA was $1,032,000. Ten years later, the Section 9 appropriation for operations was $1,029,000.

During that ten years, CATA's budget increased thirty-nine (39) percent. The Consumer Price Index increased forty-one (41) percent. Our Federal operating assistance actually decreased by $2,000. Another way of looking at the past ten years is that in constant dollars the cost of transit service remained virtually the same, but Federal assistance declined by forty (40) percent.

CATA has remained in business only by virtue of rapid increases in local government support and fare increases. While the local taxpayers have a responsibility to support the bus service, what started out in the late seventies as a fifty-fifty partnership between the Federal and local levels has now become more like a 25-75 partnership. I believe I am safe in speaking for local governments in asking that steps be taken by Congress to reach a balance in roles once again.

Transit is being asked to help meet national goals--clean air, less dependence on foreign oil, and providing mobility to persons with disabilities. We are glad to be asked and hope we are up to the challenge. CATA has been buying buses with wheelchair lifts since 1981 and now has fifty-five (55) percent of the fleet accessible. We began a fledgling paratransit system three years ago, but we are concerned that we will not have the money to operate a more comprehensive and low-fare paratransit service that may be required by the Americans with Disabilities Act.

Our local governments have had great difficulty in making up the gap in the subsidy of bus service. There has been virtually no money left over to match the Section 9 capital assistance in most years. Last year, we were able to buy our first new bus in <u>seven years</u>. We may buy <u>two</u> this year. The average age of our fleet is twelve years, and we are operating some buses that are twenty years old. The Urban Mass Transportation Administration felt so sorry for us that they recently arranged for a system in another state to give us their ten-year old discards, which lowered our fleet average age. I say all this as an objection to the Administration's proposal to raise the capital matching requirement from 20% to 40%. If that happens, CATA and dozens or even hundreds of systems like it will simply be priced out of the market of Federal capital assistance.

I cannot see the logic of the Administration's proposal to restrict the operations assistance to only certain expenditures like tires and parts and not fuel and labor. Our riders won't be very well served if we have the best steel belted radials and new transmissions if we have to leave buses in the garage because we can't pay the fuel bill or if we have to lay off drivers. Capping the operating assistance at 1991 levels and spending down the trust fund balance is not a "hold-harmless" provision: it is a five-year plan to get out of the transit business.

As I understand the reauthorization bill being advanced by this Subcommittee, we are in agreement that Federal funding for transit should begin in 1992 at the $6.7 billion level, and that it should increase, not decrease, over the next five years. If all we have to agree upon is how fast it should increase, we are indeed in a new world.

If your plan is successful it will be a tremendously important reversal of the disinvestment of the last ten years. Spending down the trust fund balance will restore faith in the process.

I want to encourage you to do even more in restoring the faith. Arkansas motorists pay about $17 million a year into the Mass Transit Account. Each year we get back less than one-half million dollars, a return of about 2 to 4 cents on the dollar. This lack of equity makes it difficult to ask the local governments and voters for more money. They don't understand why a poor rural state has to subsidize expensive rail systems around the country.

The large transit systems obviously need Federal assistance just as we do. But the current programs so heavily favor a few states and a few large systems that the lack of equity is becoming a major issue. Bus systems served 5.7 billion passenger trips in 1990, compared to 2.4 billion by rail[1]. Bus systems are deserving of a bigger share of the funds. In many ways, bus systems have a harder job in that we are trying to become a viable mode in cities that have grown up around the automobile, while rail cities are serving urban areas that have grown up around them. Try as we might, land development patterns have not changed and suburbia still grows. Bus transit should not be limited to just

---

[1] APTA Transit Ridership Report, Mar. 27, 1991

the older parts of our cities. It will take more investment to provide suburban mobility, however.

Another issue that I hope you will address is the delays and preconditions that accompany grants from UMTA. Just last year CATA's operating assistance was delayed eight months while we awaited decisions from the Department of Labor concerning the agreements with third parties. CATA had to borrow money form local banks to stay in business, and came within thirty minutes of ceasing operations entirely at one point. We believe that reasonable timetables should be established for the grant process, and that grants should be awarded to let the service continue while agreements are mediated by the Department of Labor. Holding up funds destroys the concept of a level playing field for the parties involved in negotiations.

The UMTA proposal would eliminate operating assistance for areas with over one million population, would change the definition of operating assistance to "non-capital expenses", and would cap that allocation at 25% of an area's apportionment or an amount equal to an area's FY91 operating allocation. CATA believes the current definition and allocation formula for operating assistance should remain unchanged. There is no need to change definitions and increase paperwork, especially for smaller systems.

The UMTA proposal would allow transit funds to be transferred to highway projects (and vice versa). While the Arkansas Highway and Transportation Department has become a strong advocate for transit, we do not see the need to implement this on a nationwide basis. The citizens who need public transit don't have strong lobbyists and spokespersons to ensure that their needs are met. Flexibility will be a more useful concept once transit systems are more accepted and more developed around the country. I think we are at least ten years from that day.

The UMTA proposal would eliminate designated recipient status for areas under 200,000 population. CATA opposes that proposal because smaller areas have the need to control their own grant allocations just as larger areas do. CATA would support changes to strengthen the stability of designated recipient status for all areas that currently have it.

We believe there should be increased support to the Section 18 and 16(b)2 providers. We are very supportive of the goals of HR 1079, the Mobility Assistance Act. Its provisions to help the small urban and rural operations might go a long way toward addressing the equity issue.

Our riders deserve a first-class transportation mode. We will not make significant progress toward important environmental and balance-of-payment goals unless we attract auto users, and that also requires a first class transportation mode. I believe we are very close to taking those necessary steps, and I know the entire transit industry looks forward to your progress on this important legislation.

##

Hearing

Before The

Subcommittee on Surface Transportation

Committee on Public Works and Transportation

United States

House of Representatives

April 22, 1991

Ft. Smith, Arkansas

Testimony of

Gordon A. Kinch

James River Corporation

PO Box 2218

Richmond, VA 23217

804-697-3055

# Written Testimony of

# Gordon A. Kinch

My name is Gordon A. Kinch and my business address is PO Box 2218, Richmond, Virginia 23217.

At our Ft. Smith facility we employ about 1,000 people and produce a wide variety of Dixie Paper Products utilized by restaurants, fast food chains, hospitals, offices, factories, stadiums and schools across the country.

Like you James River supports a multi-year reauthorization plan which stresses the need for better coordination among the nation's transportation modes and recognizes the impact our highways have on competitiveness. Facilitating intermodalism is an important step in improving U.S. productivity and widening market opportunities for our goods both at home and in global commerce. Identifying and providing adequate funding for the major highways facilitating the flow of commerce is another important step in this process. James River also supports taking the Highway Trust Fund off budget to better insure that these revenues are spent for their intended purpose.

There is one element James River respectfully requests be incorporated into any reauthorization plan approved by your subcommittee. This proposal would greatly enhance the efficiency of our nation's trucking industry, and make the U. S. highways a full partner in increasing U. S. productivity. It is supported by the Administration and certain members of your committee.

James River is asking that your highway reauthorization legislation include the provisions contained in H. R. 1064, Safe and Competitive Trucking Act of 1991, and sections 508 and 305 of H. R. 1351, the Administration's highway reauthorization plan.

These provisions represent billions of dollars in increased productivity by eliminating duplicative paperwork requirements that have no clear safety or other public interest benefit. Their enactment would help the trucking industry better fulfill its potential in meeting James River's intermodal needs by giving it additional flexibility in tailoring service packages better to meet our customers' needs.

These comments are meant to augment the comprehensive plan outlined last year. Attached for your information is a copy of the proposal, which makes the nation's highways a full partner in U. S. Efforts to effectively compete in global commerce.

In short, this plan calls for:

A reorganization and restructuring of national transportation policies and procedures to develop an integrated approach to logistics and supply chain issues.

Prompt spending of all federal Highway Trust Fund revenues so that the nation's road system receives the critical care it needs to more effectively foster U. S. participation in domestic and international commerce.

A continued emphasis on safety as well as a new focus on technological and environmental considerations so that transportation contributes to achieving clean air and related goals.

Exploration of new financing sources after current federal balances are spent.

An end to intermodal conflicts which erode productivity and needlessly add to the cost of sourcing, marketing, and distributing U. S. goods.

Prompt implementation of productivity improvements that will end unnecessary government-imposed costs on the trucking industry and improve overall national productivity.

James River appreciates this opportunity to present our views. We look forward to working with you and your staff on this important issue so that this country benefits from the safest and most efficient national highway system possible. If James River can be of any further assistance, please do not hesitate to contact me.

Respectfully Submitted,

Gordon A. Kinch

Legislative/Regulatory Affairs

STATEMENT BY

TAUNYA KOPKE, TRANSIT DIRECTOR
COMMUNITY RESOURCE GROUP, INC.
OZARK PUBLIC TRANSIT

BEFORE THE
HOUSE PUBLIC WORKS COMMITTEE
SURFACE TRANSPORTATION SUBCOMMITTEE

PUBLIC HEARING
FT. SMITH, ARKANSAS
APRIL 22, 1991

UMTA REAUTHORIZATION

Mr. Chairman, Members of the Committee, my name is Taunya Kopke. I have been the Director of Ozark Public Transit (Ozark) since 1986. Ozark is a community transit system operating in four northwest Arkansas counties, including a small urbanized area.

The Ozark system operates 37 small buses and vans, employs 30 persons, mostly part-time, depends upon over 80 volunteers, and serves an area with a population of approximately 230,000. We provide 210,000 demand-response rides a year.

Most of our riders are persons with disabilities, senior citizens, or factory workers.

Ozark is supported by UMTA's Section 18 program and by its Section 9 Governor's Apportionment program. I hope the reauthorization process will result in a recognition of the success of UMTA's efforts in rural communities and small urban communities, and that it will serve to rectify some of the problems we have experienced with UMTA's programs.

Rural Transit

Ozark operates one of about 1,200 rural transit systems in the nation. 38.2% of Americans live in rural communities. Rural systems serve some very remote areas. One Ozark passenger is so isolated that he actually rides a horse to a neighbor's house to call us. We have one route that includes an 80 mile section of rough stoney road without even a gravel surface, and it usually carries a full load of passengers.

The benefits of public transit for elderly rural people are just what you would expect to see in a big city - independent access to goods and services is assured - independence makes it possible to avoid moving into an institution. One elderly passenger responded to a recent survey, "It [public transit] makes it possible for me to buy my own groceries, pay my bills, take care of myself in a lot of ways, all on my own. That helps me keep my independence. I'm all for that."

The benefits of public transit for younger rural passengers are equally important. Industries in American cities are dependent upon the employees delivered by the light rail and bus systems created by UMTA. In the same way, many rural and small urban businesses depend upon employees who commute using UMTA's small community transit buses and vans.

And just as public transit for the impoverished neighborhoods of big cities opens the door to advancement for urban people, and supports the expansion of urban economies, so providing it in rural and small urban areas assures advancement for rural people, and furthers the development of rural and small urban economies.

Employers in Northwest Arkansas tell us that continued economic growth in our region depends in part on finding employees for the jobs created, and that many available workers have no transportation of their own. County social services administrators in Arkansas, charged with implementing the Welfare Reform Act, which requires welfare recipients to work,

tell us that welfare reform will succeed where public transportation is available, and that it will fail where public transportation does not exist.

UMTA's twelve year old policy of support for rural and small urban transit has resulted in very important improvements in rural life for those who have access to Section 18 service. Section 18 has created opportunities for independence and advancement for thousands of rural and small urban communities. Operators have demonstrated that rural communities do have mobility needs, and that those needs can be met.

Unique Rural & Small Urban Problems

Rural and small urban systems have some unique problems with UMTA programs:

1. Funding Equity. The Section 18 program has been allocated less than 3% of UMTA's general fund appropriation - this to serve the mobility needs of 38.2% of the population. Arkansas receives a mere $760,000 a year from the Mass Transit Account of the trust fund, in spite of the fact that Arkansans pay in about $25 million.

2. Planning & Technology. Transit technology training & transfer, research, and planning have long focused on large-scale, big-bus solutions to mobility problems, which do not adapt well to rural needs.

3. Regulations. Federal regulations are written with large-bus systems in mind. The $5 million insurance criteria for ICC authority makes it impossible for rural and small urban systems, operating buses too small to justify $5 million in

liability insurance, to operate service across state lines. It means that unemployed people in Oklahoma cannot work in Arkansas, where the jobs are, even though the commuting distances are small. It also means that the elderly residents of Bentonville cannot go to the Azalea festival in Muskogee, and that retirees in Bella Vista cannot have regular service to Carthage or Springfield or Tulsa.

4. Matching Requirements. UMTA's local match requirements act to discriminate against rural and small urban transit systems, because the vast majority of rural and small urban communities are too small to operate their own systems.

I have enclosed a list of the local governments within my region. There are 43 of them. I really should request funds from 43 elected bodies - submit 43 budgets, attend 43 hearings, prepare 43 sets of reports, maintain an accounting system designed to track revenues and costs for 43 different auditors, and respond to 43 different sets of questions about what the service should look like.

In reality, most rural and small urban match is provided by human service agencies who divert funds from client services. This means some other federal agency is being asked for funds to replace funds diverted to meet UMTA's requirement. The matching requirements leave systems struggling to serve people who are not anyone's clients. They also present financial and administrative nightmares, which will not be undertaken by any but the most determined organizations.

The nightmare is compounded for operators relying upon both Section 18 and Section 9's Governor's Apportionment program (for urbanized areas smaller than 200,000), because the matching ratios for the two programs are not the same.

These problems are not shared by big city operators, who simply submit a bid each year to an elected body with taxing authority.

Problems Shared with Urban Systems

Rural operators also face many of the same problems faced by our big city counterparts. The enactment of the Americans with Disabilities Act last year has us struggling to find funds to improve the accessibility of our equipment. The Commercial Drivers License Act, and the higher minimum wage have us struggling to find funds to pay higher driver wages. Insurance costs continue to increase. These changes threaten to push us backward, just as we desperately need to move forward to meet increasing demand.

It is ironic that as we struggle to find funds to pay for more transit service, rural systems in Arkansas probably conserve about 2 million gallons of gasoline each year. Gasoline dollars, which might otherwise go to pay for foreign oil, instead stay in Arkansas to support our own economy.

Conclusion

In short, while Section 18 and Section 9 have done much to help develop strategies and technologies for meeting rural and small urban mobility needs, we operators often feel we are

wandering around in the dark, because the federal commitment to rural and small urban systems has thus far been so limited.

What is needed for community transit to achieve its potential is first for it to be recognized as important to rural development and other national objectives. Congress should adopt a more equitable approach to funding, and should allow UMTA to move forward to develop a comprehensive strategy for coordinated rural and small urban transit.

I am a member of the Community Transportation Association of America (CTAA), and the Arkansas Transit Association (ATA). These organizations are developing specific recommendations pertaining to the reauthorization. I would ask you to give them consideration. Specifically, I would urge support for the following:

1. You should adopt the provisions of the Mobility Assistance Act, recently introduced.

2. RTAP support for training and technology transfer should be increased, along with support for planning and research designed to meet rural and small urban needs.

3. I would urge you to make a special study of the impact of the matching requirements on the development and nature of rural and small urban public transit, and upon other federal initiatives. It is my view that rural and small urban communities will not gain equal access to transit service until UMTA reduces the proportion of local funds required by Section 18 and the Governor's Apportionment program in Section 9. In addition, the two sets of requirements should be made the same.

4. UMTA's Section 18 recipients should be exempt from the ICC requirements pertaining to insurance.

Thank you for this opportunity to express my views. I will be happy to try to respond to any questions you might have.

BASED ON MUNICIPAL STREET AND COUNTY ROAD TURNBACK FUNDS FOR C.Y. 1990

Robert E. Lee, President
Texarkana Chamber of Commerce

Testimony for
Surface Transportation Sub-Committee

Ft. Smith, Arkansas
April 22, 1991

My name is Robert E. Lee. I am President and CEO of the Texarkana Chamber of Commerce. The Texarkana Chamber represents the cities of Texarkana, Arkansas and Texas. It is also the headquarters of the Mid-America Connection Compact (MAC-PAC). MAC-PAC is an association of over 900 members from ten states in America's heartland. The membership includes Chambers of Commerce, state senators and representatives, mayors, county judges, corporate executives and hundreds of other citizens. They all share a common goal - the up-grading of U.S. Hwy. 71, from Kansas City, Missouri to Shreveport, Louisiana, to a four-lane controlled access highway.

On behalf of Texarkana and MAC-PAC, I express our appreciation to the members of the Surface Transportation Sub-Committee and Congressman John Paul Hammerschmidt for holding this public hearing.

I am here to address the merits of a project of major importance to eleven states in America's heartland.

First I would like to call the Committee's attention to the Kansas City, Missouri to Shreveport, Louisiana Multi-State Freeway Corridor Study. This study, prepared in response to the Federal-Aid Highway Act of 1987, was completed in December, 1987. It was approved by the United States Department of Transportation in April, 1988. Construction of the proposed freeway would:

1. Fill a gap in the existing North-South interstate system some 500 miles wide.
2. Connect I-29 and I-35 in Kansas City with U.S. Hwy. 59 at Texarkana, Texas and with I-49 at Shreveport, Louisiana thus providing the best possible route from the Canadian border and Great Lakes to the ports of Houston and New Orleans.
3. Serve eleven states in Mid-America with a combined population of more than 45 million people.
4. Stimulate economic growth in areas of Louisiana, Arkansas and Missouri where unemployment averages 5% above the national average and where per-capita income is only 54% of the national average.

5. Enhance national defense by providing a modern highway critical to United States strategic defense policy. There are thirteen major military installations in the states of Arkansas, Louisiana, Missouri, Oklahoma and Texas within the proposed freeway corridor.
6. Enhance the ability of existing industry and business along this corridor to compete successfully in the world marketplace.

Secondly, I call attention to the Surface Transportation Act of 1991. This Act calls for the establishment of a National Highway System (NHS). The NHS is defined in Sec. 102.(a) as follows:

> "to provide an interconnected system of principal arterial routes which will serve major population centers, ports, airports and international border crossings; meet national defense requirements; and serve interstate and interregional travel"

The Kansas City to Shreveport corridor study clearly demonstrates that U.S. Hwy. 71 meets every requirement for inclusion in the NHS. The U.S. Department of Transportation, by approval of the study, clearly documents this highway (in its present condition) cannot fill its appropriate role in the system.

Finally, I call the Committee's attention to the safety of those people who are forced by either employment or domicile to drive on U.S. Hwy. 71. There are 272 miles of two lane highway. Over 200 miles are in hilly or mountainous terrain. In Arkansas alone, over 800 are injured and 34 killed annually.

Everyone who has studied the surface transportation needs of the United States, and the money available to address these needs, knows the difficulty of this committee's task. H.R. 1351, as written, provides only one funding formula for construction and improvements to those highways in the National Highway System. Under such a plan, states are almost certain to use available funds to address politically expedient intra-state projects before those of national importance.

Certain segments of the NHS are just as critical to the nation's general welfare and defense as the Interstate Highway System was when designed. We believe the Surface Transportation Act of 1991 should provide funding for construction of those segments critical to either national defense or having multi-state benefits at the same level as Interstate Highways. This would assure each state assigning a high priority to these segments.

The case for up-grading U.S. Highway 71 to, at the least, a four-lane divided highway with full access control in urban areas is clearly documented. The DOT approved feasibility study of the Kansas City to Shreveport freeway coupled with Hwy. 71 meeting all criteria for the National Highway System makes it clear this badly needed improvement cannot be allowed to wait any longer.

On behalf of the almost 20 million Americans who live within fifty miles of the Mid-America Connection corridor, I thank the members of the Committee for the opportunity to meet with you today.

PMAA PETROLEUM MARKETERS ASSOCIATION OF AMERICA

## *Statement of*

Mr. Conway Massey
On Behalf Of
The Petroleum Marketers Association of America
And
The Arkansas Oil Marketers Association

## *Before the*

Subcommittee on Surface Transportation of
The House Public Works And
Transportation Committee

## *On*

President's 1992 Budget and Legislative
Proposals for Surface Transportation Programs
H.R. 1351

1120 VERMONT AVENUE, NW • SUITE 1130 • WASHINGTON, DC 20005 • (202) 331-1198

MEMBERS OF THE PETROLEUM MARKETERS ASSOCIATION OF AMERICA

The Petroleum Marketers Association of America (PMAA) represents the independent petroleum marketers who are members of these state and regional trade associations:

Alabama Oilmen's Association
Arizona Petroleum Marketers Association
Arkansas Oil Marketers Association, Inc.
California Independent Oil Marketers Association
Colorado Petroleum Marketers Association
Independent Connecticut Petroleum Association
Florida Petroleum Marketers Association
Georgia Oilmen's Association
Idaho Oil Marketers Association
Illinois Petroleum Marketers Association
Indiana Oil Marketers Association, Inc.
Petroleum Marketers of Iowa
Kansas Oil Marketers Association
Kentucky Petroleum Marketers Association
Louisiana Oil Marketers Association
Maine Oil Dealers Association
Michigan Petroleum Association
Mid-Atlantic Petroleum Distributors Association
Mississippi Petroleum Marketers Association
Missouri Petroleum Marketers Association
Montana Petroleum Marketers Association
Nebraska Petroleum Marketers Association, Inc.
Nevada Petroleum Marketers Association
Independent Oilmen's Association of New England
New England Fuel Institute
Fuel Merchants Association of New Jersey
New Mexico Petroleum Marketers Association
Empire State Petroleum Association
North Carolina Petroleum Marketers Association
Northwest Petroleum Association
Ohio Petroleum Marketers Association
Oklahoma Oil Marketers Association
Oregon Petroleum Marketers Association
Pennsylvania Petroleum Association, Inc.
Petroleum Marketers Association of Wisconsin
South Carolina Oil Jobbers Association
South Dakota Petroleum Marketers Association
Tennessee Oil Marketers Association
Texas Oil Marketers Association
Virginia Petroleum Jobbers Association
Washington Oil Marketers Association
Western Petroleum Marketers Association
West Virginia Petroleum Marketers Association
Wyoming Petroleum Marketers Association

The Petroleum Marketers Association of America is located at 1120 Vermont Avenue, N,W., Suite 1130, Washington, D.C. 20005. Telephone: (202) 331-1198. FAX: (202) 467-6330

Good morning Mr. Chairman and members of the subcommittee. I appreciate the opportunity to testify before you today. My name is Conway Massey, and I am General Manager of A.B. Littlefield Oil Company, and we supply over 185 service stations/convenience stores/truckstops in Arkansas, Oklahoma, and Missouri. Of these, twelve are built to serve the interstate, and six are truckstops. Littlefield Oil employs 50 people.

I am appearing today as a representative of the Petroleum Marketers Association of America (PMAA) and the Arkansas Oil Marketers Association, a member of PMAA. PMAA is a federation of 44 state and regional trade associations representing more than 11,000 independent petroleum marketers. These marketers sell over half the gasoline, 75 percent of the home heating oil and 60 percent of the diesel fuel consumed in this country. Eighty-nine percent of PMAA's membership are small businesses. The Arkansas Oil Marketers Association has represented wholesale distributors since 1942, and its members sell half of the gasoline and diesel consumed in Arkansas. These marketers provide the fuel we all need to get to work, take our children to school and harvest crops.

The information this subcommittee is obtaining through these field hearings is very important. You are receiving crucial information on the state of this country's infrastructure, and the needs of communities throughout the country; at the conclusion you will be deciding what role the federal government should play in highway development in the coming years. Your task is enormous, particularly in these times of fiscal restraint by the federal government.

We appreciate the constraints you face, the need in this country for new highways, and the substantial maintenance tasks ahead. However, the petroleum marketing industry fears that the legislation prepared by the President, H.R. 1351, that would raise revenue for states by allowing them to lease land at rest areas or along the interstate for commercial development would be very harmful to the marketing segment of the petroleum industry. Currently, such leases are prohibited by Section 111 of Title 23 of the United States Code.

From our industry's perspective, such a change would be an inappropriate and unfair reversal of current law which would be counterproductive in its effect on the investments that companies like Littlefield Oil have made over the years. We oppose such a change for several reasons.

First, additional stations are not necessary along the interstate system. As you know, at most highway interchanges, service stations have been constructed to serve the motoring

public, and generally they operate 24 hours per day to ensure the traveling motorist of fuel supplies at all times. Marketers have indicated that nearly every available and economically viable interchange has been developed. I would also note that competition for the motorist is vigorous at these interchanges, with a variety of businesses selling both branded and unbranded product to the passing motorist. This vigorous competition leads to lower gasoline prices and customer convenience as each motorist can select the brand of gasoline that he desires and can utilize an appropriate credit card as necessary. We believe the present system serves the motorist very well.

Allowing a state to lease land along the interstate could be extremely harmful to my business and the other businesses that I am representing today and seriously undermine the investments they have made adjacent to the interstate. In my experience, sites on the interchange are leased or sold at between two and ten times the cost of sites not on the interchange. While competition should always be encouraged by the Congress, my business cannot fairly compete if I pay rents based on my judgement that the site I leased is the best available to serve the motoring public, when in fact much more attractive sites directly on the interstate are put in direct competition with me.

When Littlefield Oil purchases or leases such an interchange site at a premium price, I know that I must sell high volumes of fuel. Introducing a new competitor at a rest area will undercut the marketing decision I made when I picked that location and will probably prevent me from selling the high volumes that are necessary to be profitable. And without profit, Littlefield Oil cannot afford to pay rent, federal, state and local taxes, and wages to my employees.

While I understand and sympathize with the plight of the states and their need to find additional revenue, I do not believe that destroying the livelihood of or undercutting investments made by small businessmen is an appropriate method of seeking that revenue. I also do not think they realize the lost income tax or property taxes that will result from this proposal.

An additional problem with allowing new commercial development on the interstate is the Highway Beautification Act. Through the efforts of Congress, much of the interstate system is well landscaped and is free from the visual pollution of excessive commercialization; billboards are prohibited and in many cases there are no effective means of advertising services to the public. While this has beautified the interstate system, it prevents me from advertising my services in advance of the exit.

Under the present system, I have two methods of informing potential customers of my facilities' location. First, shortly before the exit, on most interstates I am allowed to rent space on

an official interstate sign. On this sign, the brand of gasoline sold is indicated; there is no mention of price. Second, I can use an extremely tall sign at the service station to tell the motoring public that my stations are at a particular location. If rest areas are opened for gasoline delivery, how will I compete for the highway traveler who is interested in price, convenience and a particular brand of gasoline. The rest area will obviously win out in the convenience category. And as you can see, my advertising tools will not permit me to describe my brand and prices at a meaningful time to the passing motorist. When he approaches a commercialized rest area, he probably won't know that my stations are only a few miles down the road. In contrast, a rest area will be advertised for many miles through the state's rest area signs and the type of gasoline sold will be readily visible from the interstate. I believe that these factors will result in the passing motorist utilizing the on-highway site for his fueling needs.

A final concern is that our members are likely to be financially excluded from ever participating in leases along the interstate if this prohibition is removed. A state interested in leasing service station space along the interstate easement will probably attempt to lease all sites to one bidder to minimize administrative costs. If Section 111's prohibitions are lifted, a state might request that a bidder offer to build service stations every 40 miles in an effort to maximize their revenues from this program. For example, the state of Arkansas might indicate that service stations are to be built every 40 miles along Interstate 40, 30, and 55, for a total of ten new rest areas. Members of PMAA and AOMA, however, typically operate 4-5 service stations and thus would be financially incapable of building 10 new service stations. As a result, the bidding would default to those major oil companies who are interested in operating stations in a particular state. Alternatively, Arkansas might request that service stations be installed at each of the 14 rest areas along the interstates. Again, most of our members would not be capable of financing such construction. Thus, our members with sites on interstate exchanges would be forced to watch as their competitors obtain premium sites in direct competition with them.

In conclusion, the original interstate authorization act clearly established that the interstate system would not be a commercial corridor. Businesses, including marketers, have relied on that decision to construct on interchanges and continue to make substantial investments to maintain and improve their facilities. A sharp change in the rules at this time would not be fair to these businesses who have and who will continue to provide public services.

PMAA and AOMA respectfully urges you to oppose any proposal to modify 23 U.S.C. § 111 to allow commercial development on interstate highway easements in the next highway authorization

bill. We thank you for your consideration of this matter and I'll be happy to respond to any questions you might have.

STATEMENT TO SURFACE TRANSPORTATION SUB-COMMITTEE

ANALYSIS OF U.S. HIGHWAY 71 NEEDS

FORT SMITH, ARKANSAS

APRIL 22, 1991

BY JERRY MONTGOMERY, MAYOR
CITY OF MENA, ARKANSAS

Mr. Chairman and members of the Committee, I am Jerry Montgomery, Mayor of the City of Mena, Arkansas. Mena is located in west central Arkansas and has a population of 5,500 with an estimated trade area of 25,000. On behalf of myself, the city council , and all the citizens of Mena, I sincerely express our gratitude for the opportunity to appear before this distinguished committee.

In our search for industries to locate in our area, we have found that most companies prefer to locate in an area no more than thirty miles from an interstate or four-lane highway system. The nearest interstate highway to Mena is approximately 80 miles away. Studies by the Missouri Department of Economic Development show that transportation is the third most important factor to companies considering a location. Studies by the Arkansas State Highway and Transportation Department revealed that the second higheat commodity desire flow patterns through the state occur from the Kansas City area southward toward the Gulf of Mexico. Kansas City is one of the largest Interior Foreign Trade Zones in the country and a major benefit of an improved

four-lane divided highway with limited access control would be to increase the exporting products produced in western Missouri and the central states to the Gulf of Mexico ports of New Orleans.

The western side of Arkansas was excluded in the development of a four-lane interstate program, and this has had an adverse effect on our economic growth because of an inadequate transportation system through our region of the state. Four of our state's largest employers, Emerson Electric, Wal-Mart, J.B. Hunt Transport, and Tyson Foods, are very heavy users of U.S. Highway 71.

In our area of the state, tourism, which effects our local economy by creating thousands of jobs, is highly dependent upon quality highways. It is a known fact that many tourist and vacationers by pass our beautiful region simply because the highway system is inadequate and dangerous. The magnet to entice tourist to the numerous lakes and rivers is an improved U.S. Highway 71, which would assist in the full development of both natural and human resources.

The existing Highway 71 in western Arkansas is a two-lane highway, serving a high traffic volume and insufficient passing sight distances. Motorist must contend with steep inclines and segments of highway that have a narrow surface with a 10 feet per lane and no shoulders. Motorists' safety is a major issue on this existing north-south route.

Sections of the existing two-lane Highway 71 has a current annual average of six accidents per mile resulting in 3.2 injuries per mile and one death every 4.7 miles.

Considering lead and construction time and budgetary constraints faced by Congress, I believe a practical approach would be to upgrade Highway 71 to a four-lane divided highway with limited access control. This approach would avoid much of the expense of planning new routes, acquiring expensive right-of-way, and minimize environmental impact studies and effects. An entirely new Interstate system would not likely be completed within my lifetime whereas an improved Highway 71 would give Mena and Polk County much needed relief in a shorter period of time.

In closing, I want to thank Congressman Hammerschmidt for the opportunity to appear before you and give you this message from our people. Western Arkansas is such a beautiful part of our country. I hope you enjoy your visit.

# ADDRESSING THE TRANSPORTATION CHALLENGES OF NORTHWEST ARKANSAS

A Presentation to the

Committee on Public Works and Transportation

Subcommittee on Surface Transportation

One hundred second Congress

U. S. House of Representatives

Norman Y. Mineta, Chairman

April 22, 1991

John M. Lewis, President
Bank of Fayetteville
One South Block
Fayetteville, Arkansas 72701
(501) 444-4444

45-155 O—91——76

ADDRESSING THE TRANSPORTATION CHALLENGES OF NORTHWEST ARKANSAS

April 22, 1991

The Surface Transportation and Uniform Relocation Assistance Act of 1987 expires on September 30, 1991. The debate triggered by the upcoming expiration of the legislation, and the completion of the Interstate System, presents a major generational opportunity for the 102nd Congress to frame a new surface transportation policy responsive to the needs of today's economy and tomorrow's opportunity.

The rich potential of this opportunity to create a new national highway system as the focus of federal-aid to highways in the post-Interstate era can only be achieved by shaping programs which address the fundamental changes in the nation's economy and demographics which cry out for solution to the problems of a deteriorating surface transportation system.

It is within this changed environment that Congress must fashion the objectives and programs of a new national surface transportation program. A new highway infrastructure program must be designed, as Chairman Roe has stated, "to invest in the rebuilding of America's infrastructure and halt the decline in this Nation's productivity."

Mr. Chairman, it pleases me to tell you and your committee that western and northwestern Arkansas is one of the most productive areas in our nation. In this area reside corporations that are competitive with any companies in our nation or the world.

It was my pleasure to report to you in the last hearing held in this area the reasons for this. The genius of our entrepreneurs, the productivity and care of our workforce, the intense local competitive environment and the University of Arkansas with its technical and managerial expertise that assist these companies in upgrading their talents.

A continued investment by our government in the needed infrastructure of our area is going to benefit an area that is paying its way in taxes and taxing itself for further improvements.

President Bush, Secretary of Transportation Samuel K. Skinner, and the Federal Highway Administration have long stated the need to develop a strong federal and state partnership for highway development.

Arkansas, and its people, have shouldered responsibility for their share of that partnership. Arkansas has just enacted a 36 percent increase in its gasoline tax and a 47 percent increase in its diesel fuel tax to fund the state's portion of a $2.4 billion program to improve Arkansas highways.

I am pleased to note that the first project to be announced from that new Arkansas highway program calls for the construction of U. S. 412 as a four-lane facility to connect Northwest Arkansas to Interstate 44 along Oklahoma's Cherokee Turnpike which is currently under construction.

To paraphrase from Chairman Roe's recent comments at a field hearing in Washington State, Arkansans are willing to invest more than a nickel for improved roads in Arkansas.

Therefore, we believe that now is the time for the federal government to join the partnership with Arkansas by enacting a new highway program which will accomplish the following objectives:

- o provide for the addition of a limited number of nationally significant routes to the Interstate System and provide for the construction of those selected new routes under a 90/10 federal/state funding ratio.

- o Specifically, we would urge your consideration of Interstate 49 from Shreveport, Louisiana to Kansas City, Missouri for inclusion in the new Interstate System, for it is truly one of those nationally significant routes which should be completed.

Having said that, Chairman Mineta, I must continue to say that I share your concern about the maintenance of our existing Interstate System. But, the nation must also address those voids in the current Interstate System which deprive a small number of rapidly growing and vibrant regions of our county from participation in the nation's Interstate System.

To fund the construction of those new routes, we encourage Congress to enact a plan for the fiscally prudent and responsible spend-down of the Federal Highway Trust Fund balances to fund a strong program which meets the nation's needs for surface transportation infrastructure.

Once again, Chairman Mineta, I agree with your comment that underfunding transportation represents "economic suicide in a new world order."

In that regard, I applaud the budget request submitted by the Public Works and Transportation Committee to the Budget Committee last month which calls for the Highway Trust Fund balance to be spent down to $7 billion.

In conclusion, let me commend the Public Works and Transportation Committee and its staff for its work on the Surface Transportation Assistance Act of 1991. The task is momentous, but one that this distinguished group of Congressman can complete; thereby ensuring that a surface transportation is enacted which invests the people's resources in the future of America.

Remarks for the Committee on
Public Works and Transportation
Ft. Smith, Arkansas
April 22, 1991

Presented by
Charles W. Mudd
Vice President, Operations
Contract Freighters, Inc.
Joplin, Missouri

Contract Freighters, Incorporated, CFI, is a privately held, irregular route truckload carrier started in 1951 and based in Joplin, Missouri. We operate more than 1,000 trucks and 2,500 trailers throughout the contiguous 48 states, all bordering Canadian provinces and Mexico as far south as the Yucatan Peninsula. We operate terminal facilities in 9 U.S. locations.

As a trucking company we are particularly interested in the structure and progress of the 1991 Surface Transportation Assistance Act. We are all aware, the health and development of our nation's infrastructure is directly related to, and to a degree can dictate, the productivity and profitability of our economy. As a trucking company that handles a large amount of international freight, we see the quality and efficiency of our infrastructure as the key factor to our nation's participation and leadership in the quickly developing "global market." We must maintain the ability to move goods and materials across our nation with the same, and even better, effective precision as other nations with less territory and better infrastructure investment.

We believe this to be a vitally important topic. We also want to recognize the extremely difficult task you have in developing the United States' plans for the future in this area and thank you for the opportunity to add our comments today for your consideration.

First, CFI strongly supports any measures included in the act that insure the maintenance and upkeep of the current highway system, with particular attention to bridges. A system to monitor the effective, efficient use of funds for these programs must be included.

CFI also supports efforts to encourage the construction of toll roads to fund new highways, allowing better utilization of tax monies. Tolls are an easier, more definite charge for a trucking company to deal with, and are in line with the general philosophy that a direct user pays the fee.

Our first preference is for the toll to be eliminated, or at least reduced to a minimum maintenance fee once construction costs are covered. If tolls are continued, excess revenues absolutely must be specifically designated for highway system purposes.

In the same light, all of the present trust fund monies and all highway and fuel tax dollars designated for the needs of our infrastructure at no time and under no circumstances should be used for any other purpose, including efforts to balance the federal budget. All of these funds should be released and used for their intended purpose.

We believe the number of adequate rest areas should be addressed. It's common to see trucks and cars parked along entrance and exit ramps at night for lack of adequate rest areas. Some states will ticket a vehicle parked on a ramp when there is really no other place to rest. This is an important safety issue for both truckers and motorists.

Finally, I want to discuss a local topic. Southwest Missouri and western Arkansas have a strong interest in designating Highway 71 as part of the Interstate Highway System. With a plan of connecting Kansas City and Shreveport and better still, Houston, Texas, through Joplin, Missouri and Ft. Smith, Arkansas a valuable corridor to CFI, the local economies and the previously described international market will be developed. This lane is currently needed for existing traffic and would quickly grow into a major commercial lane. CFI supports any efforts to develop the Highway 71 corridor.

Thank you once again for the opportunity to express our concerns and please feel free to contact myself or CFI to participate in any public forum.

**Statement by**
**Ross Pendergraft**
**Executive Vice President and Chief Operating Officer**
**Donrey Media Group**
**Before the House Public Works and Transportation Committee**
**Fort Smith, Arkansas**

Thank you for this opportunity to speak on behalf of the people of western Arkansas and eastern Oklahoma.

In 1975, the U.S. Department of Commerce predicted the next growth pattern for this nation. It said the cities of the Twenty-First Century would be intermediate population centers of under 100,000 population with surface, air, rail and water transportation, located within one day's truck travel of such major distribution points like Dallas, St. Louis, Memphis and Chicago. Additionally, these new American cities would have an abundant supply of low-cost energy, such as natural gas. That description totally fit only one American city in 1975 — Fort Smith, Arkansas.

Now, I invite your attention to what actually transpired during the past 15 years — from Knoxville, Tenn., to Nashville to Memphis to Little Rock to Fort Smith to Tulsa and Oklahoma City. At intervals of approximately 125 miles to 200 miles clear across America, intermediate population cities have boomed economically and have recorded rapid population increases, particularly in the Sun Belt and the heartland of the America. This growth has occurred along the interstate highway system and parallels the 1975 prediction by the the Department of Commerce.

Despite creation, growth and development of perhaps a dozen major truck lines in this region, including the fifth largest commercial hauler in the United States, one gap in this growth pattern stands out. That gap, of courses, is U.S. Highway 71 along the western border of Arkansas that generally has been neglected in federal highway funding. This neglect has adversely impacted the people and economies of both western Arkansas and eastern Oklahoma for three decades.

For almost 40 years, the people of this region, their per capita income, their public safety and their overall standard of living have been the victims of that oversight by Congress in the 1950s. Relying on their own self-sufficiency, location and the natural resources of this region, the people of western Arkansas have made remarkable progress in literally pulling themselves up by their bootstraps. I do not have to tell you the homegrown and national corporations that have chosen to locate along this neglelcted transportation corridor, primarily because of its proximity to the population center of this country. Additionally, I would be less than truthful if I did not give part of the credit for Fort Smith's development during the past 15 years to the federal/state partnership that produced Interstate Highway 40, our east-west lifeline to much of America.

As the publisher of more then 50 newswpapers in some 20 different states, my company, like most manufacturers, depends heavily on surface delivery of materials and supplies, not to mention distribution of our finished product. To an even greater degree than most other business enterprises, we are committed to the economic development of the communities we serve. Our success or failure — and the level and quality of services we provide our readers — depend on advertising revenues. Those revenues rise or fall in direct relationship with the economic health of the total community. Certainly, we have a vested interest in expanding U.S. Highway 71 to interstate-quality, but so do the more than a quarter-million readers of our three daily newspapers situated along that corridor.

I submit that in addition to the immediate and desperate needs of the people of western Arkansas — business operators, professionals and workers alike — the entire country has a stake in surface transportation in this region, particularly between the Missouri line and Texarkana, Texas. The inferior quality of U.S. Highway 71 is a national defense concern. It is the missing link in our national distribution system for goods and services.

U.S. Highway 71 is a dangerous and outdated roadway that has claimed 122 human lives in just the past 48 months in this state alone. Just within 30 miles north and south of this city, between 1,000 and 1,500 traffic accidents have occurred in that same period of time. And between the Missouri state line to the north and Texarkana to the south, at least 1,000 men, women and children have sustained serious injuries that required hospitalization. A new highway of interstate quality can and will significantly reduce this needless bloodshed.

In conclusion, I beg you to do all in your power to give the people of this region something I believe they should have been given when the first Interstate Highway Act was enacted: an even break with the rest of America to help themselves and their country. Do that, and I can assure you, the people of western Arkansas won't let you down. Thank you.

# Testimony
# For
# SURFACE TRANSPORTATION SUB-COMMITTEE

By

JOE D. POWERS
Chairman of the Board
Fort Smith Chamber of Commerce

Fort Smith, Arkansas
April 22, 1991

April 22, 1991

Testimony by: Joe D. Powers
Chairman of the Board

For: Surface Transportation Sub-Committee

CHAIRMAN MINETA, CONGRESSMAN HAMMERSCHMIDT AND MEMBERS OF THE SURFACE TRANSPORTATION SUBCOMMITTEE, I AM JOE POWERS, CHAIRMAN OF THE BOARD FOR THE FORT SMITH CHAMBER OF COMMERCE. WE SINCERELY APPRECIATE YOU COMING TO FORT SMITH TO HOLD THIS IMPORTANT PUBLIC HEARING AND WANT YOU TO KNOW THAT WE CONSIDER IT A DISTINCT HONOR FOR THE CITIZENS OF THIS AREA.

OUR NUMBER ONE PRIORITY FOR DISCUSSION HERE TODAY HAS TO BE THE UPGRADING OF HIGHWAY 71 FROM KANSAS CITY, MISSOURI DOWN TO SHREVEPORT, LOUISIANA. THIS NORTH-SOUTH CORRIDOR IS ABSOLUTELY ESSENTIAL FOR THE ECONOMIC GROWTH AND DEVELOPMENT OF MID-AMERICA. THIS IS NOT JUST AN ISOLATED, LOCALIZED NEED, IT'S THE CONNECTING LINK FROM CANADA TO THE GULF OF MEXICO THAT ALLOWS MID-AMERICA TO COMPETE IN THE INTERNATIONAL MARKET. THERE ARE ELEVEN STATES IN THIS CENTRAL PART OF THE UNITED STATES WHICH ACCOUNT FOR MORE THAN 45 MILLION PEOPLE. WE ARE GRATEFUL FOR THE PROGRESS BEING MADE ON HIGHWAY 71 TO THE NORTH BUT THERE IS AN ABSOLUTE VOID WHEN IT COMES TO CONNECTING FORT SMITH WITH TEXARKANA WHICH WOULD COMPLETE THE MISSING LINK IN THIS NORTH-SOUTH CORRIDOR.

WE HAVE OVER 200 MANUFACTURERS IN THIS LOCAL AREA BUT THEIR "JUST IN TIME" PRODUCTION SCHEDULES, PUT TREMENDOUS PRESSURE ON THE MOTOR FREIGHT CARRIERS TO PROVIDE FAST, RELIABLE SERVICE. AGAIN, LOCAL CARRIERS ARE HANDICAPPED IN THEIR EFFORTS TO DELIVER GOODS TO MARKETS IN MISSOURI, TEXAS AND LOUISIANA IN A TIMELY MANNER. LOCAL MANUFACTURERS ARE ALSO HAMPERED WHEN THEIR PRODUCTION SCHEDULES

DEPEND ON THE TIMELY RECEIPT OF RAW MATERIALS FROM THOSE MARKETS. THIS IS A DISTINCT DRAWBACK WHEN IT COMES TO RECRUITING INDUSTRIAL PROSPECTS. WE ARE RIGHT IN THE MIDDLE OF A TREMENDOUS GAP IN THE EXISTING NORTH-SOUTH INTERSTATE HIGHWAY SYSTEM. WE NEED THIS FOUR-LANE THROUGH HERE NOT ONLY FOR ECONOMIC GROWTH AND DEVELOPMENT BUT ALSO IN THE INTEREST OF NATIONAL DEFENSE. THERE ARE 12 TO 15 MILITARY INSTALLATIONS LOCATED IN OUR SURROUNDING STATES AND OUR NARROW, TWO-LANE WINDING ROADS ARE HARDLY SAFE FOR HAULING WEAPON SYSTEMS AND SUPPORT EQUIPMENT BETWEEN THEM. WE BELIEVE THAT THIS PARTICULAR SEGMENT OF HIGHWAY IS A CRITICAL PART OF THE NATIONAL HIGHWAY SYSTEM AND SHOULD BE GIVEN A HIGHER PRIORITY IN THE INTEREST OF THE NATION'S WELFARE AND DEFENSE.

I'D NOW LIKE TO SHIFT TO SOME COMMENTS REGARDING THE SURFACE TRANSPORTATION ASSISTANCE ACT OF 1991. PLEASE KEEP IN MIND THAT I AM IN THE BANKING BUSINESS AND I AM NOT A TRANSPORTATION SPECIALIST, HOWEVER, I WOULD URGE YOU TO CONSIDER THE FOLLOWING: (A) MAINTAIN THE FEDERAL AID URBAN SYSTEM AND OTHER CATEGORICAL FUNDING PROGRAMS RATHER THAN COMBINE MANY OF THEM IN A NEW URBAN/RURAL PROGRAM. (B) MAINTAIN THE CURRENT FUNDING MATCH RATIOS RATHER THAN REDUCE THE FEDERAL SHARE WHILE INCREASING THE STATE/LOCAL SHARE. (C) IF THE URBAN/RURAL PROGRAM IS IMPLEMENTED, DEVELOP A MECHANISM TO ENSURE THAT THE VARIOUS STATES DO NOT ESTABLISH A COMPETITIVE ENVIRONMENT, NOT ONLY BETWEEN THE URBAN AND RURAL AREAS, BUT ALSO AMONG THE URBANIZED AREAS WITHIN THE STATE. (D) STRONG SUPPORT SHOULD BE GIVEN TO THE RETENTION OF THE INTERSTATE PROGRAM AS IS PROPOSED BY THE ACT. THIS PROGRAM WOULD PRESENT THE BEST METHOD OF FUNDING AND BUILDING THE SOUTHERN EXTENSION OF U.S. HIGHWAY 71 AS A FOUR-LANE CONTROLLED ACCESS FACILITY. IF IT IS NOT IDENTIFIED AS AN INTERSTATE HIGHWAY, IT WOULD GO INTO THE LARGER GROUP OF PROJECTS UNDER THE URBAN/RURAL PROGRAM WHICH COULD BECOME A COMPETITIVE PROGRAM AND WEAKEN THE TIMELY COMPLETION OF THE U.S. 71 PROJECT. (E) IF THE ACT IS PASSED AS IS PROPOSED, THERE IS A SECTION OF THE ACT THAT ENABLES THE DESIGNATION AND FUNDING OF SCENIC BYWAYS. THE SIGNIFICANCE OF THIS SECTION IS THAT

THE EXISTING U.S. 71 COULD BECOME ELIGIBLE FOR SUCH A DESIGNATION ONCE THE NEW HIGHWAY BETWEEN FAYETTEVILLE AND VAN BUREN/FORT SMITH IS COMPLETED. SUCH A DESIGNATION WOULD HELP MITIGATE THE ECONOMIC LOSSES THAT ARE LIKELY TO OCCUR ALONG THE OLD HIGHWAY DUE TO THE DECREASE IN TRAFFIC AND USAGE. THIS DESIGNATION, AND THE SUBSEQUENT IMPROVEMENTS TO THE HIGHWAY, WOULD CREATE A PARKWAY ENVIRONMENT SIMILAR TO THE BLUE RIDGE PARKWAY AND SERVE AS A CATALYST FOR CONTINUED ECONOMIC ACTIVITY AS WELL AS NEW DEVELOPMENT THAT WOULD SUPPORT THE INCREASING TOURISM INDUSTRY. (F) UNDER THE PROPOSED ACT, THERE ARE SPECIAL FUNDS FOR INNOVATIVE RESEARCH PROJECTS. THESE FUNDS WOULD BE AVAILABLE FOR BOTH PLANNING AND CONSTRUCTION. HOPEFULLY, FORT SMITH COULD PURSUE THESE FUNDS IN AN ATTEMPT TO RESOLVE THE GROWING TRAFFIC PROBLEMS ON OUR MAIN THOROUGHFARE, ROGERS AVENUE. FORT SMITH HAS SUBMITTED THE PHOENIX AVENUE EXTENSION PROJECT AS A PARTIAL SOLUTION TO THIS EXISTING PROBLEM. YOUR SUPPORT WOULD BE MOST APPRECIATED.

IN SUMMARY, THE NEED FOR AN UP-GRADED U.S. HIGHWAY 71 HAS BEEN CLEARLY DOCUMENTED FOR SEVERAL YEARS. IN THE INTEREST OF PUBLIC HIGHWAY SAFETY, THE INJURIES AND FATALITIES ARE TOTALLY UNACCEPTABLE WITH INDIVIDUAL MOTORISTS AND MOTOR FREIGHT CARRIERS USING TANDEM TRACTOR-TRAILER RIGS DRIVING THESE NARROW, WINDING, TWO-LANE ROADS TO HAUL EVERYTHING FROM CHICKENS TO HAZARDOUS MATERIALS. WE MEET THE CRITERIA TO BE A PART OF THE NATIONAL HIGHWAY SYSTEM AND HOPEFULLY, WE ARE CONVINCING YOU THAT THERE IS AN URGENT NEED TO COMPLETE THIS LAST GAP IN THE NORTH-SOUTH CORRIDOR WITHOUT FURTHER DELAY. THE OLD-TIMERS DOWN HERE TELL US TO SOLVE A DIFFICULT PROBLEM, YOU MUST FIRST "PICK UP A PENCIL" OR "TAKE THAT FIRST STEP". LADIES AND GENTLEMEN, WE'VE REACHED THAT POINT WHERE WE SIMPLY MUST TAKE THAT FIRST STEP AND MAKE THAT FOUR-LANE HIGHWAY A REALITY AND WE MUST DO IT NOW!.

ONCE AGAIN, I WANT TO THANK YOU FOR CONDUCTING YOUR MEETING HERE IN FORT SMITH AND ALSO FOR ALLOWING ME THE OPPORTUNITY TO SPEAK WITH YOU.

STATEMENT OF JAMES C. REGNIER

A four-lane highway down the corridor of western Arkansas is what we need.

There can be little argument that our interstate systems have reduced the number of accidents and made travel much more efficient as well as safer. However, for those areas which do not have immediate access to a four-lane highway, the prospects for economic growth are much gloomier. We in Waldron, Arkansas, can testify to that statement as we have seen several prospects choose development sites along I-40 during the past several years.

Why do the people of our area need economic growth?

1. Scott County has been ranked in the lowest 20% for per capital income in the U.S. for 1950, '59, '69, and '79. Poverty is persistent and the first requirement is jobs for the people. The opening of western Arkansas would give us the opportunity to attract those jobs.

2. Scott County has a total population of approximately 10,500 and its only community of any size (Waldron) has a population of roughly 3,000 of that total. Rural counties are often heavily dependent on a single industry for economic viability. In order to protect the area from swings in business cycles, we must attract a diversity of industry. But any industry must have a means of moving its product to markets. A four-lane system will provide such means.

3. The residents of Scott County are particularly dependent on roads. Arkansas ranks 15th nationally with 911 of every 1,000 licensed to drive. The four-lane would open up our county and make travel much safer and more efficient to those numbers who must seek jobs in Ft. Smith.

4. Waldron and Scott County enjoy an excellent modern health care system. However, when specialist or special services are demanded, the result is a forty-five mile trip over what must be one of the poorest stretches of U.S. highway in the nation.

5. Scott County and Waldron have always taken great pride in their public schools. However, many of our graduates must leave to find jobs and, particularly, many of our brightest young people have no choice but to leave. We must create jobs which will provide an opportunity for those young people to remain and help continue to build.

6. Even with the lack of industry and jobs, the Waldron area continues to grow. Surrounded by Ouachita Mountains with several large mountain ridges traversing the county, we are certainly one of the most beautiful areas in the nation. In a state which counts tourism as a major economic force, this four-lane system would traverse one of the most scenic vistas in the state and make it accessible to more tourist than ever.

7. Western Arkansas has the ingredients for the explosion of growth that northwestern Arkansas has been experiencing. We have an attractive tax base, pleasant climate, an available work force with a strong work ethic, a scenic countryside, and ample power and water to support growth. A four-lane system will provide the access to this area which is just beginning to witness an influx.

8. Major industries in Scott County include one of the largest Tyson production plants, Sampling Technology, Inc., which is a leader in world production of air monitoring equipment, and a large agriculture and timber industry. Other smaller industries share with these a need for access today, a need which will continue to grow.

Along with our citizens, I strongly commend Representative Hammerschmitt for his foresight in seeing the urgent need for this project and for his efforts to provide this development.

James C. Regnier, President
Waldron Area Chamber of Commerce
Waldron, Arkansas

STATEMENT OF L. P. LARRY RENARD

April 18, 1991

Good Afternoon,

I am L. P. (Larry) Renard, Chairman of the Industrial Development Committee of the Nashville, Arkansas Chamber of Commerce. I am also Chairman of the Industrial Association of Nashville. Those jobs are part time and community projects. I am employed full time as President and General Manager of Briar Gypsum, and that is the job that pays my salary and pays my expenses to travel here today.

The people I am representing in Nashville, Howard county, and Southwest Arkansas support the construction of interstate highway 49 and/or the highway 71 corridor. We even go so far as to say we support increased taxes for the construction and improvement of the highway system.

Southwest Arkansas has decent interstate highway connections to the Southwest and Northeast portions of the United States using interstate 30. We have fair interstate connections to the East and Southeast parts of the United states, going to Shreveport and using Interstate 20, but our connections to the South are poor, and to the North very poor. This 71 corridor,and the feeder roads that will run into it, will provide us a much safer highway system to the North and to the South.

Nashville and Howard county, the area I represent, has experienced considerable industrial growth in the last several years.

Nashville is a town of approximately 4,500 people, and we have over 3,000 employees working in our industrial facilities. Our traffic is bumper to bumper in the mornings and evenings. The industrial plants have been asked to stagger their starting and quitting times to help the traffic problems.

Our in bound, as well as our out bound truck traffic, is heavy. The business I represent ships an average of 40 semi trailer truck loads of material out every day. We ship very little material north because of the highway system. Potential customers in the northwest part of Arkansas tell us it is easier, cheaper,and better for them to buy their material in from western Oklahoma, which is one hundred miles further away, rather than to buy from us and haul north on U. S. 71.

There have been several studies and committee hearings reguarding improving highways, and the people I represent have given testimony supporting improved highways each time. The three studies I am familiar with are; "Transportation 2020", which was a federal committee that held hearings and was suppose to develop a concensus on a national transportation plan to meet America's needs in the 21st century. The second was the Arkansas State Highway Department's "Economic Development Corridor Improvements" concept. This concept proposed connecting all cities in Arkansas with a population of 10,000 or more with a four lane highway, and connecting all cities with a population of 5,000 or more with a four lane highway within 20 years. The third was an outgrowth of the second and was "An Economic Impact Study-Intrastate Corridor System-1990/2010." All these studies recommended Interstate 49 and/or the Highway 71 Corridor, and we in the Nashville area support those conclusions. If you haven't,

I highly recommend to you, as a member of this committee, that you obtain a copy and read the study, "Economic Impact Study-Intrastate Corridor System 1990/2010", by the Southwest Arkansas Planning and Development District, Inc. This study does an excellent job reviewing the economic impact the Highway 71 Corridor will have on Southwest Arkansas.

Our aim and goal in Nashville and Howard county is to raise the standard of living for our community, and we just happen to believe this can best be accomplished by industrial development, while maintaining our rural atmosphere and protecting our environment.

Thank you for being here today and listening to my remarks.

ED WARMACK

Chairman Mineta, Committee Members, and Friends:

A friend of one of my sons was pursuing employment - his first pre-requisite was that the work calendar not include Friday or Saturday. Thanks to all of you for giving up your weekend to be in Fort Smith, Arkansas, today! John Paul continues to be of the "old school" and spends most of his weekends here in Western Arkansas working with his friends.... you know he doesn't have any enemies...

Some one hundred years ago the City Fathers tried, to no avail, to negotiate Fort Smith's becoming a part of the Rock Island Railroad East-West arm between Memphis, Little Rock, Oklahoma City, Amarillo, Tucumcari, New Mexico, and points west, with Fort Smith being on the main line of the Kansas City Southern Railroad operating between Port Arthur, Beaumont, Shreveport, Texarkana and Kansas City, and being a division point for both railroads.

With the city's losing these two main lines, it is impossible to measure the amount of growth Fort Smith missed by not having this advantage.

We appreciate your Committee's approval of the Waldron Road project and solicit your consideration and help on the Phoenix Avenue extension project.

We are most thankful to have Interstates 40 and 540; both have given relief to our local, as well as through, traffic.

We hope funds will be set aside for the construction of Interstate 49, or Mid America Artery, during the next allocation for Interstate Road Systems; north from Houston/New Orleans through Texarkana/Fort Smith, Kansas City, etc. would give this area a tremendous boost. If funds are not available in the foreseeable future, and your committee feels that funds will be more readily available for this artery to be a toll road similiar to the toll roads in Oklahoma, we would consider it a favor for you to advise us in order that we may expedite our requests.

Central Mall, the largest shopping complex in the State of Arkansas, was built in 1970. It continues to be the primary shopping facility in western Arkansas and eastern Oklahoma. There is no question that Fort Smith would become a larger retail market with the completion of the north/south Interstate 49.

May we also call to your attention the amount of additional tourism that would be generated by a north and south artery of "Interstate quality."

Today Fort Smith's household count is 28,200. With more than 85,000 people coming to their jobs in Fort Smith every normal working day, and more than half from outside Fort Smith, our highway system is congested.

During the first half of this century, railroad main lines made that tremendous difference. Today Interstates make that tremendous difference!

Any improvements made in our road system would be most appreciated. We hope our highway needs and street requests are given favorable consideration! Thanks again for being here today.

# STATEMENT OF JERRY A. YARBOROUGH

ABF Freight System, Inc.
301 South 11th Street
Fort Smith, Arkansas 72901
501-785-8700

Report to the:

Subcommittee on Surface Transportation
Committee on Public Works and Transportation

Regional Field Hearing
Fort Smith, Arkansas

ABF Freight System, Inc. and its affiliates comprise the nation's fourth largest national motor carrier of general commodities. ABF has 327 terminals located in all 50 states, Canada, and Puerto Rico, and employs approximately 10,000 people. 1990 revenue was 765 million dollars. ABF operates 3,500 power units and 11,000 twin trailers. Intercity miles in 1990 totaled 237 million.

In light of recent information being disseminated pertaining to long combination vehicles, drug use in the trucking industry, and highway wear caused by trucks, we feel it important to report our experience and position on these issues.

LONG COMBINATION VEHICLES

In 1985, ABF commenced a shift toward the use of 28-foot twin trailers versus 45-foot long single vans. During 1986, ample numbers of both types of vehicles were operated essentially under the same conditions. The rate of accidents reportable to the Department of Transportation ("DOT") for single long vans was 628,000 miles per accident, while it was 2,400,000 miles per accident for twin trailer combinations. The twin trailer rate has continued to improve. Now 28-foot trailers make up 99 percent of the ABF trailer fleet.

ABF has utilized triple trailer combinations in the states of Idaho, Oregon, and Utah since 1985. During the six years through 1990, ABF has operated triple 28-foot trailers 4.5 million miles and has been involved in two DOT-reportable accidents.

Our experience proves that long combination vehicles do not have higher accident rates. On the contrary, twin trailers are four times safer than single vans, and triple trailers are slightly safer than twin trailers.

DRUG USE

Since mandatory drug testing became law in December of 1989, 3,680 ABF drivers have been screened for drugs during their DOT physical examinations. A total of seven individuals tested positive, which represents a rate of 0.19 percent.

A total of 2,055 job applicants have been screened for drugs during pre-employment physical exams. There were 19 positives, which equates to 0.92 percent.

Based on the drug testing to date, the incidence of drug use that ABF has discovered is only a tiny fraction of what is purported by some to exist among truck drivers.

HIGHWAY WEAR

We believe that before a large investment is made to upgrade the U.S. highway system, it would be prudent to research the issue of pavement design and wear. If pavement wear is found to be strongly dependent upon vehicle speed, ABF would support strict enforcement of a 55-mph speed limit for tractor trailer rigs.

Jerry R. Yarbrough
Senior Vice President

ADDITIONS TO THE RECORD

Leggett & Platt
INCORPORATED
THE COMPONENTS PEOPLE
NO. 1 LEGGETT ROAD • CARTHAGE, MISSOURI 64836 • 417/358-8131

STATEMENT BEFORE

THE HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

Relating to

HIGHWAY 71/I-29 CORRIDOR

By

DR. LANCE BESHORE

Vice President - Government Relations

Leggett & Platt, Incorporated

October 6, 1990

Mr. Chairman, my name is Lance Beshore and I'm the Vice President for Government Relations at Leggett & Platt, Incorporated. I'm pleased to respond to the opportunity to appear before you today to discuss this important matter of Highway 71/I-29 corridor, as it pertains to our company, our region, and I believe, our nation.

Leggett & Platt is currently in its 107th year of continuous operation. We were founded in Southwest Missouri as a partnership in 1883. The company was then incorporated in 1901 and has always remained headquartered in Carthage, Missouri, just east of Joplin. Today we are a New York Stock Exchange company, and have grown to the rank of 350 in the Fortune 500,

based on reported sales of just over $991 million for 1989; with annualized sales now above $1 billion, Leggett & Platt has approximately 12,000 employee/partners working in facilities throughout the United States and in Canada.

In Southwest Missouri alone, Leggett & Platt has eight operations employing 1,200 men and women. Major operations in Carthage include the Corporate Office (to which we're currently adding 52,000 square feet), two research and development centers, a machine rebuilding operation, a steel wire drawing mill, a manufacturing plant for springs and other wire products, plus the company's Flex-O-Lator Division. A wood products division is in Springfield, Missouri. Recent facilities' expansion in the local area include an addition to the Research and Development Center for Manufacturing and Engineering Services and a new hangar for the corporate aircraft at the Joplin Municipal Airport. Leggett & Platt has achieved most of its growth since 1960 when current management assumed responsibility for the company's direction. At that time, annualized sales were about 7 million from only 3 plants. After more than 25 years of consistently

profitable growth, management still believes that the company has many attractive opportunities for future growth. In pursuing these opportunities, Leggett & Platt continues to specialize in manufacturing and marketing a broad and growing line of components and related products for the home furnishings industry and diversified markets.

With this as background, Leggett & Platt wishes to go on record as strongly endorsing the U.S. Route 71 improvements as they pertain to the project running between Kansas City, Missouri and Shreveport, Louisiana. Being home based in Southwest Missouri and having a trucking fleet within the larger parent company that consistently drives in excess of 160,000 miles in Arkansas, in particular during the last 12 months, we can speak with some experience as to the complications involved in using the present road system. Leggett & Platt owns and leases over 60 trucking units, as well as other carriers, to shuttle between Carthage and all points throughout the United States, but in particular, Fort Smith, Arkansas. We have a facility in Fort Smith that employees 48 people and contains 54,000 square feet. We make sleepers and trundles for such customers

as La-Z-Boy, Sealy, etc.

U.S. Route 71 improvements are needed to provide a dual lane traffic facility built to interstate standards and become a part of the north/south multi-state freeway. This would greatly alleviate the capacity problems that we find are predominate along the existing routes. Traffic counts continue to rise; injuries and fatalities continue to escalate; and in general the infrastructure road system continues to deteriorate.

The social demands of the Ozarks being one of the fastest growing rural areas in the United States and the economic development along this corridor, have become evident in this area and indicates a critical need for increased highway capacity. Joplin is ranked as Missouri's fourth largest urban area behind St. Louis, Kansas City, and Springfield, respectively. Joplin, Missouri and the Rogers/Springdale, Arkansas area continue to grow as major national motor carrier hubs. Projections based on the 1980 and the estimated 1990 census indicate that the three counties involved in this project from Missouri, Jasper, Newton, and McDonald, are continuing to grow. The increases are displayed on the following page.

| County | 1970 | 1980 | EST. 1990 | PROJ. 2010 |
|---|---|---|---|---|
| Jasper | 79,852 | 86,958 | 92,554 | 101,121 |
| Newton | 32,981 | 40,555 | 44,980 | 53,412 |
| McDonald | 12,357 | 14,917 | 16,326 | 18,554 |

Joplin, Carthage, Neosho, Rogers, and Springdale continue to develop as major employment centers indicating high commuter traffic between these areas.

We believe that transportation in general throughout our nation and Arkansas and Missouri in particular are the key to success. All of us enjoy the convenience and economic benefits of a first rate transportation system. But we must continue to invest in our transportation system to compete in the global marketplace. Please consider our strong support and plea to fund this important project.

Thank you again for allowing Leggett & Platt the opportunity of commenting on these important issues to our region and to our nation. I'd be happy to answer any questions that you may have.

LGB/cdd

STATEMENT OF

ANN HINES

BOARD OF DIRECTORS

ARKANSAS HIGHWAY USERS CONFERENCE

HOUSE PUBLIC WORK AND TRANSPORTATION COMMITTEE

SUB-COMMITTEE ON SURFACE TRANSPORTATION

HEARING ON THE

REAUTHORIZATION OF THE POST

INTERSTATE SURFACE TRANSPORTATION PROGRAM

FORT SMITH, ARKANSAS

APRIL 22, 1991

Mr. Chairman and members of the Committee, my name is Ann Hines. I appear before you today as a member of the Board of the Directors of the Arkansas Highway Users Conference. I am pleased to share with you the views of the Arkansas Highway Users Conference in regards to the need to reauthorize the Federal-aid Highway Program.

The Arkansas Highway Users Conference is a coalition of state associations and businesses working to improve the safety and efficiency of the state and federal highway transportation system.

Our members and other highway users across the country have paid the highway user taxes which have allowed our nation to build a first class highway system which has enabled our businesses and the nation's economy to prosper. Our capital investment in the Interstate System has had a major impact in improving the nation's productivity and in making the roads safer for the highway user whether he be an over the road commercial carrier or the neighbor next door sight-seeing and vacationing across our country.

We are reaching the end of an era, in just a short time -- the Interstate System, which was started a little over 30 years ago will be completed. However, the job has not been finished, we are simply finishing another chapter in the history of our great nation. As we look forward to the next 30 years, we have a big challenge. We have a tremendous capital investment in the nation's highway system which must be preserved. We have changed from a rural society to an urban society. It was almost ten years ago in 1983 that the citizens of the United States and the Congress came to the conclusion that we had

many unresolved needs in our highway transportation system. The result was an increase in the federal motor fuel tax which was dedicated to the Highway Trust Fund. Highway users agreed to and worked for this tax increase because they knew that their tax dollars would truly be used to preserve and improve our highway transportation system. This pay-as-you-go method of road financing had after all provided us with the world's safest and most efficient highway transportation system.

This trust between highway users and the Congress was breached last October when the Congress increased the motor fuel tax by 5 cents per gallon with half of this increase now going to the general fund for deficit reduction purposes. Actually, the trust was breached before this ill-conceived idea passed the Congress last fall. Highway users in the last few years have not been reaping the full benefits of the taxes paid each year. As these highway user taxes went unspent, the trust fund balance was allowed to build to levels beyond reasonable reserves that should be in this account.

The highway program has not been funded at the levels that Congress agreed to in both the 1982 and 1987 highway bills. As Congress delays the spending of our tax dollars, we eventually receive less because the spending value of these dollars in the future is diminished due to inflation. We believe Congress needs to correct this breach of faith with highway users, put the trust back in the trust fund and highway user taxes by spending them in a more timely manner and by correcting the error committed last fall when half of the nickel increase was allowed to go the general fund. These funds can do the nation far more good in the highway program

when they are spent in a timely fashion creating jobs directly and indirectly as these dollars turn over through the economy while at the same time we make the necessary improvements in our highway system that will help us to be more competitive with the rest of the world by helping improve our productivity.

We need to spend more on highway system. On a constant dollar basis, our spending levels have been as low as any since the nickel gas tax increase in 1983. Inflation has resulted in these "stable" dollars actually buying 25 percent less road today than in 1983. At the same time, highway traffic is up nearly 27 percent since 1983.

We all were in agreement in 1983, both highway users and the Congress that our nation had a highway transportation system need. This need has not magically disappeared in the last 8 years, it has continued to grow as our highway system has continued to deteriorate resulting in additional costs to our nation's businesses and industries along with a decline in service -- a real loss of productivity.

That is the bad news. However, there is some good news on the horizon if the right decisions are made. Congress has the opportunity to put America back on track. An increase in public capital spending on our highway system will allow the private sector to improve its productivity and profitability so that our nation's businesses and industries are again competitive in this world economy. The Highway Trust Fund is approaching the $20 Billion mark. These dollars should be put to work for America -- the trust fund really only needs a balance of 2 to 3 Billion dollars, the approximate level of the fund in 1970 when it had a balance of $2.6

Billion. The spending down of the Trust Fund balance along with the guaranteed stream of revenues from highway users will allow Congress to authorize a highway program at levels 50 percent higher for the period of this highway bill than what our investment has been in recent years. And this is possible with no increase in taxes to the highway user -- we simply need to fully utilize the taxes already paid by highway users.

I want to regress for a minute. The Arkansas Highway Users Conference continues to oppose the diversion of highway users taxes for non-highway purposes. This idea is ill-conceived, we need to put our highway user taxes to work to spur on the productivity of our nation so that we can again compete competitively in this world economy. It was a bad idea last fall and it is still a bad idea and will be a bad idea in the future.

Over the past four years, highway users in Arkansas and across the country have been involved in assessing our future needs. The Transportation 2020 process was very fruitful. The more than 3,000 witnesses at the 65 public forums across the country provided a wealth of knowledge that can assist our nation in developing a future highway program to meet our future needs.

We applaud the Administration for its efforts to develop a transportation program to help meet our future needs. Most of this plan is good, it can be made better. As one example, we believe the funding levels should be increased. The plan really needs a little fine-tuning. We ask you to carefully consider the needed refinements. We ask you and the Congress to keep in mind that the clock is ticking -- the October 1st deadline draws ever closer. We

cannot let the clock tick away putting even further behind the world in our effort to compete in this world economy. The reauthorization of this program so vital to our nation's overall well-being cannot be treated as a step-child. It must be given prompt consideration and needs immediate action to meet the October 1st deadline.

Mr. Chairman, I thank you for the opportunity to share our concerns with you and the members.

BUDDY ROEMER
GOVERNOR

State of Louisiana
OFFICE OF THE GOVERNOR
Baton Rouge
70804-9004

POST OFFICE BOX 94004
(504) 342-7015

REMARKS
FOR PRESENTATION
TO THE U.S. HOUSE OF REPRESENTATIVES
PUBLIC WORKS AND TRANSPORTATION
SURFACE TRANSPORTATION SUBCOMMITTEE

GOVERNOR BUDDY ROEMER
April 22, 1991

Ladies and Gentlemen:

Thank you for this opportunity to provide comments on behalf of the State of Louisiana in support of the Mid-America Access Project to extend I-49 from its current terminus in Shreveport all the way to Kansas City and possibly beyond. I have asked Stu Bach of the Shreveport Chamber of Commerce to present these remarks in my absence.

As you are probably aware, I-49 (in Louisiana) is nearing completion. It links I-10 and south Louisiana to I-20 in northwest Louisiana, and provides a significnt north-south artery not only for our citizens, but for the movement of goods and services through our State. It is my understanding that I-49, or a similar four-lane divided highway, could receive federal funding either as a specifically designated demonstration project, or under the proposed National Significant Highway System, currently being considered in Congress in the Surface Transportation Act and Relocation Assistance for 1992. Louisiana would prefer to have the project designated as a demonstration project, which would allow for the more expeditious completion of the entire project. Timing is crucial, and this request is urgent. Therefore, I respectfully request that you take positive action now so that this important economic development tool can be put in place in the very near future.

While the Shreveport-Kansas City linkage would benefit Louisiana, this project is not for our State alone. The completion of I-49 from northwest Louisiana to Kansas City, Missouri, will provide an economic "boom" for the five-state area (Louisiana, Texas, Arkansas, Oklahoma and Missouri), as well as provide incentives to business and industry located in the entire area and will spur economic development throughout the region. This project and the Red River navigation project will make it possible to capitalize on the business opportunities presented by the central states which this highway will serve and to which access will be provided. I, and the entire Louisiana delegation, want to encourage you and work with you in seeing that this very critical interstate project is authorized and funded in the 1992 Surface Transportation Act.

Thank you for your time and consideration in this very important matter.

STATEMENT TO SURFACE TRANSPORTATION SUBCOMMITTEE

ANALYSIS OF U.S. HIGHWAY 71 NEEDS

FORT SMITH, ARKANSAS

APRIL 22, 1991

BY REGINA WALKER, PRESIDENT
MENA/POLK COUNTY AREA CHAMBER OF COMMERCE

Chairman Mineta and members of the Committee, I sincerely appreciate the opportunity to submit a written testimony for the Committee record concerning the need for U.S. Highway 71 improvements.

Our county has a population in excess of 17,000 and the largest city in the county, Mena, has a population of 5,475. We are located in west/central Arkansas some 80 miles from the nearest interstate or four-lane divided highway.

Citizens and existing business and industry of this rural Western Arkansas community are extremely interested in the improvements of U.S. Highway 71. A large portion of the State's other highway systems seem to be met; while, we, in Western Arkansas have to contend with the narrow, winding, and hazardous conditions of U.S. Highway 71 from Greenwood, Arkansas; near Fort Smith, to Ashdown, Arkansas; near Texarkana.

I'll never forget the comparison that J.B. Hunt of J.B. Hunt Trucking made at meeting concerning the need for highway improvements in Western Arkansas. He compared driving on

45-155 O—91——77

U.S. Highway 71, from Fort Smith to Texarkana, to the low crawl under barbed wire while in the Army. He wasn't sure if he was going to make it.

Arkansas is very dependent upon industries such as Wal-Mart, J.B. Hunt, Tyson, Emerson Electric, and many other smaller firms, located in Northwest Arkansas, and it is detrimental to their continued success that an adequate highway system be available. Interstate 49 would be the ultimate solution, but due to the cost, land acquisition, longevity of building, and many other factors; the continuation of the existing four-lane divided highway with limited access control would meet our needs and provide a safe and desirable transportation route for existing industry while meeting the criteria of industries pursuing a location, and still maintain the aesthetic beauty of our part of the "natural state."

We in Mena/Polk County are blessed with natural beauty. We have Mid-America's only official scenic drive, known as Talimena Scenic Drive, and recently acquired a new state park known as the Cossatot River State Park Natural Area, which is being considered for National status. Randomly easy access to these scenic attributes would enhance their popularity and help the economic conditions of this western and southwestern part of the state.

It is my understanding that the Highway Trust Fund has uncommitted funds. Your favorable consideration for

appropriation of these funds for the extension of the existing four-lane highway from Greenwood, Arkansas, to Ashdown, Arkansas, would secure the economic future of rural Western Arkansas.

It is imperative that we have an adequate and safe highway system to accommodate industry. Studies by the Missouri Department of Economic Development show that transportation is the third most important factor to companies considering a location.

I want express my appreciation to Congressman Hammerschmidt for the opportunity to stress the significance of an improved highway system in Western Arkansas and for bringing the committee to the most beautiful part of the state.

Dear Commissioners:

The member counties of the Southwest Arkansas Planning and Development District Inc. are pleased to submit for your consideration this report entitled "An Economic Impact Study-Intrastate Corridor System-1990/2010." Southwest Arkansas is rich in opportunity and possesses many of the assets necessary to foster healthy economic growth and development.

Fundamental to this interest is our desire to preserve our existing job base as well as to offer the enrichment opportunities demanded of our highly educated and technically skilled youth soliciting challenging positions in the job market. The baseline of our future is what we provide in the way of opportunity for our leaders of tomorrow. We all too often invest in advanced educational achievement and export our greatest resource through denial of opportunity.

Opportunity responds to a multitude of factors. One asset in isolation seldom creates a force for change or an environment on which to build. The factors involved in stimulating economic development can perhaps be grouped in order of importance, but certainly not isolated singularly. The evidence presented within this report does verify the dominant importance of transportation access into and out of the surrounding markets of interdependency. Southwest Arkansas has the attitude, the resources, and the developmental willingness to move forward with progressiveness and fortitude. The attributes complemented by an improved corridor system would open our access to the major intra/inter state market networks that serve to complement mutual opportunities to enhance economic development and to further the diversification of job options essential to our future.

## ACKNOWLEDGEMENTS

Special recognition is given to Charles E. Venus, Ph.D., President of B.I.E., Incorporated, of Little Rock, for his expert advice and assistance in the preparation of this economic impact study. Dr. Venus provided invaluable comments, direction and review these past months.

Other individuals contributing to the development of the analysis process and providing support assistance included Phillip Taylor, Ph.D., Bureau of Business and Economic Research, College of Business Administration, University of Arkansas at Fayetteville, and Daniel R. Hoyt, Ph.D., Director of the Transportation Management Program at Arkansas State University, Jonesboro. Jesse Buffington, Ph.D., Research Economist, of the Texas Transportation Institute, Texas A & M, College Station, Texas, provided numerous reports and studies conducted in Texas on the development before, during, and after four lane and bypass transportation construction.

Areas 5 and 6 of the Arkansas Louisiana Gas Company in Southwest Arkansas assisted in the collection of survey data of the manufacturers through site visits, and are gratefully acknowledged.

The Arkansas Power and Light Company-Team Work Arkansas provided financial support, for which we are very grateful.

We appreciate the support and interest of the local communities, area leaders, chambers of commerce, and the elected officials of Southwest Arkansas.

# EXECUTIVE SUMMARY AND REVIEW

## An Economic Impact Study - 1990 to 2010

## Intrastate Corridor System

by Dr. Charles E. Venus

Consulting Economist

The following report is an effort to quantify the economic impacts of a highway corridor system in Arkansas for the Southwest Arkansas area. Estimates include projections of population, employment, income and state revenue. The methodology for the analysis was chosen as constrained by time and resources available and to address the primary impacts of interest.

Although the projection parameters are fairly conservative, and comparable to the before-during-after impacts noted in the literature review section, the actual population change, income change, job growth, and state revenue increases are very large. But these are the benefits that good levels of compounded economic growth deliver, this is why people the world over pursue them.

The specific benefits projected for the Southwest Arkansas Planning and Development District are:

* Economic growth, as measured by population, employment and income increases, will increase at a compounded annual rate of approximately 2.36 percent above trend for the first ten years, and for approximately 1.50 percent above trend for the following five years.

Specific impacts for the District are as follows:

* Population in 2005 will be some 73,000 greater, and in 2010, some 101,000 greater than it would have been without the highway impacts.

* Total employment will be almost 30,000 greater in 2005, and almost 42,000 greater in 2010 than without the highway impacts.

* Total personal income will be increased by about $2.4 billion in 2005, and over $3.8 billion in 2010 above the historical trend. (This area now has total personal income that is about ten percent of the state total. Its proportion will increase to about 10.6 percent in the 2005 to 2010 years - state total personal income of about $29 billion will, by the year 2010 which is 22 years in the future, be approximately $85 billion).

* State revenues will be increased by some $164 million in the year 2005, and $255 million in 2010, above what they would have been without the highway impacts. (Although the total state revenue collections, general and special, would be much larger in those years, on the order of $4 billion in 2010, this impact will amount to between four and six percent of the then revenue collections, resulting from the highway impacts).

While these overall impacts are likely, and can also be distributed among counties - which assumes each county is similarly impacted - they are intentionally not route specific. This is for two reasons:

(1) Although the routes in the corridor improvements are known, they may or may not be completed, and certainly will not be completed at one time. The timing of the improvements at specific locations is not known. Also,

(2) It is well recognized that some improved highways have extremely high economic impact, while others seem to have little or no impact - which is likely the result of the community's attitudes and other economic factors.

That economic impacts are likely but not guaranteed, is evidenced by the two Arkansas examples used to calculate the expected impact of the new corridors. As explained in the methodology section, the historical experience of the Searcy area and the Forrest City area were combined to attain an "average" impact. The results were then compared to other impact studies, particularly the before-during-after studies completed in Texas. The projected impacts in Arkansas using the "average" were generally comparable to the finding of the Texas studies.

The projected impacts may be too conservative - certainly in some areas - but they may also not be attained in other areas. But unless the nature of transportation in the United States undergoes basic changes there is ample evidence of the necessity of good highways to achieving high

levels of economic growth. There are examples of successful growth without good highways, but they are the exception.

The time and financing constraints for completing this impact analysis precluded the analysis of other variables that will be impacted by improved highways. It will appear, however, that the changes in population, employment, income, and state revenues are the primary impact variables of interest to both the general public and to state government.

ECONOMIC IMPACT STUDY - 1990 to 2010

INTRASTATE CORRIDOR SYSTEM

SOUTHWEST ARKANSAS PLANNING AND DEVELOPMENT DISTRICT

## INTRODUCTION

This report, An Economic Impact Study of the Intrastate Corridor System 1990-2010, has its origin in the following set of events. In January 1988, the Arkansas State Highway and Transportation Department presented an "Economic Development Corridor Improvements" concept for evaluation to determine its viability and potential as a force to enhance the economic development of our state. The concept will affect all aspects of the Arkansas economy directly or indirectly since improved transportation will have numerous benefits, such as decreased travel time, improved accessibility to markets, and increased employment.

The corridor improvements program, as outlined by AHTD, proposed connecting all cities with a population of 10,000 or more with a four lane highway and connecting all cities with a population of 5,000 or more within twenty years, with a four lane system. As a part of the proposal, a tourist and commodity flow network would be established to enhance access to major tourist generators and to link all major market flow routes to the corridor system. Specific routes were identified which would be upgraded as a result of this improvement program.

When the corridor concept was publicized, it was viewed with interest by many individuals and groups, among them the Arkansas Good Roads and Transportation Council. The AGRTC approached the planning and development districts with the request that they determine the economic impact of an intrastate four lane corridor system for their respective areas of the state.

In light of this request and as a result of expressed interest on the part of many persons within the Southwest District, Southwest Arkansas Planning and Development District concurred. Since time was short and staff limited, Southwest Arkansas Planning and Development District joined with White River Planning and Development District and East Arkansas Planning and Development District to utilize a team approach to conduct the analysis, an approach which would take advantage of the shared experience and resources available.

The report as finalized is an effort to evaluate the degree of economic impact that would ultimately be realized in Southwest Arkansas from a highway capital improvement program sponsored by the State of Arkansas; a program designed to upgrade the state's primary intrastate highway network to a four lane corridor system. The field of the study is limited to the twelve county area comprising the Southwest Arkansas Planning and Development District. It is, however, dependent upon the studies prepared by the other participants representing the remaining portion of the state. A fully operational corridor is contingent upon a

four lane system which interconnects with other segments to fully create a comprehensive intrastate transportation network.

This study purposely did not predicate the specific corridor routes that were identified by the Arkansas State Highway and Transportation Department as the primary segments that would be upgraded in accordance with ASHTD's proposed three-tiered improvement plan. A non-route specific study allowed the flexibility to evaluate the merits of the proposed system as well as any alternatives that might be considered within a given socioeconomic or political setting.

The flexibility to comparatively analyze these alternatives was built in by virtue of two decisions clearly formulated as a basis of the study approach. It was determined to assess the economic impact of an intrastate corridor system on an equal county-by-county basis. The second decision was to develop a survey of business and industry designed in such a way as to elicit information regarding directional route flows for incoming raw materials and outgoing products as determined by the existing business and industrial operations which comprise the Southwest Arkansas economic base.

The first decision--to assess the economic impact at the county level--allowed the study to reflect the direct impact that a four lane corridor would have in each county if a corridor were developed in that county or within timely access of the

principal city of each county. It also provides a basis for measuring the impact for the defined study area, the Southwest Arkansas region, as well as cumulatively for the state as a whole.

The intent of the second decision was not to identify specific route segments, but to identify the market regions which support the economy of the area. The survey of manufacturers provided the local input of the region to determine the internal and external market flow.

This study utilized a simplified format and methodology for reasons of necessity and design: of necessity, since the report was prepared under an assigned time constraint of roughly 75 days, and, of design, because the full study, from methodology through assumptions and analytical applications, is intended to be easily understood and readily usable by all of the people for whom this report is ultimately prepared. These are the people who collectively represent the interests of the area and who will make the final decision as to what improvements are necessary, to the existing transportation system, to both support and enhance the economic direction Southwest Arkansas wishes to take.

This report is submitted to the leaders of Southwest Arkansas as a basis from which to negotiate a final, segment specific

improvement program to upgrade the transportation facilities throughout our region of the state in an attempt to advance our economic potential in the national and world marketplace. Transportation improvements have a large potential to impact Southwest Arkansas. In combination with the other prerequisites of economic growth--improved educational opportunities, a productive workforce, adequate physical infrastructure, and more importantly, leadership from the local level--transportation improvements will allow the people of Arkansas to redouble their economic development efforts in order to create a stronger, more vital economy for the future.

One closing point must be emphasized: we have conducted, in a short period of time, a logical and reasonable analysis of the resultant impacts that can be expected from a definite course of action; we cannot and will not make major decisions concerning route specific locations that set and direct the future of our area for years to come without the time to fully incorporate the thinking and desires of those whom we work for and with as part and parcel of the process.

It gives us great pleasure to present this document to the elected officials and representatives of Southwest Arkansas and through them to the people at large. We are confident that it will serve as the basis to define the course of direction for our area that best satisfies the transportation support needs required to stimulate the advancement of our inherent economic potential.

## CORRIDOR PROPOSAL IMPACT

The original approach of the study was to identify those counties within Southwest Arkansas Planning and Development District that had an obvious potential impact from the construction of the four lane corridor improvements program. After some thought, it was decided to look at all the counties with the assumption of enhancement, if a four lane road was constructed within or near proximity to a county. The more rural counties of the region, without direct impact, would benefit from any road improvement construction in adjoining counties under positive impact circumstances.

The March 11, 1988 Information Release from the Office of the Director of the Arkansas State Highway and Transportation Department stated that currently proposed four lane highways, identified on the Economic Development Improvements Program map, may be eliminated, changed, or others added. At this time, it is anticipated that the routes might well be modified.

In the preliminary analysis, consideration was given to cities already located on existing four lane arterial roads. It was determined necessary to examine communities reasonably comparable to the specific area of study. Metropolitan areas, such as Little Rock or Fort Smith, were not as relatable as

communities of nearer size, for example, to the cities situated on the proposed four lane corridors.

The City of Searcy, located in White County, and Forrest City, in St. Francis County, stood out in the comparative study. Superficially, it was not expected that the two communities would project similar patterns, but during the data analysis, growth trends appeared within each set of data, which transmitted similar trends. As a result of this methodology, Searcy/White County and Forrest City/St. Francis County statistics indicated a pattern of growth, which could be replicated to other communities, with established parameters. The methodology section details the analysis used.

The corridor proposal impact will be relevant, in a large part, to the other factors present in the given situations. Sound physical infrastructure, a skilled workforce, well-managed natural resources, accessibility to technology, quality of life, a solid fiscal and tax structure, and the availability of development tools are the resources the counties have to develop in preparation for economic growth. Effectively managed local governments and strong leadership, with good transportation, improved education, and a high quality of life at reasonable tax rates are the first steps to be taken toward making local economies competitive.

The enhancement analysis was conducted with a conservative "at best" philosophy to determine impact if the other factors were in place within a community or area. It is noted that some areas are more advanced in their development of other elements affecting the quality of life, and therefore can expect a higher level of impact. The following table delineates this philosophy, applied to population and per capita personal income for the twelve counties of the District, and applied to total personal income and state tax revenue on a District level.

Data analysis principals dictate the larger the sample base, the more accurate the application of the trend projections. The size of the sample base data at the county level was not large enough for accurate projections. For that reason, the District level was used in the final analysis to determine regional enhancement of the state tax revenues.

FOOTNOTES TO TABLE:

1. County population figures from 1960 to 2000 supplied by Research and Public Services - UALR. using rate of change calculation, the District projected the population for the years 2005 and 2010.

2. Adjusted projection same data as cited in (1) above through 1995. Year 2000 to 2010 represent an annual growth rate of 2.36 percent applied to the rate of change for the historic trend from the 1995 base population for the decades of 2000 and 2005. The 2010 adjusted population represents an annual growth rate of 1.50 percent added to the historic trend from the base year of 2005.

3. Per Capita income figures were derived from U.S. Census data for 1960, 1970, and 1980. These figures were projected to the year 2010 using a Linear Regression Model. Adjusted projections were calculated using the annual rates of growth discussed in (2) above, from the base year of 1995.

4. Total State Reenues were derived by applying a factor of .0676 to the difference between the historic trend and adjusted projection of Total Personal Income. This figure represents the enhancement created by corridor development.

   The factor of .0676 was obtaind from a model Dr. Phillip Taylor of the Bureau of Business and Economic Research - College of Business Administration - University of Arkansas, Fayetteville uses to predict increases in State revenue from increases in personal income in the State of Arkansas

5. Projections of employment increases were derived by applying a multiplier of .41 to the the difference between the District population projection from historic trends and the enhanced District porojection attributed to corridor construction.

   The multiplier was derived from the percent relationship total 1985 state employment is to total 1985 state population in 1985. This relationship was then applied to the total District population estimates to arrive at an estimate of employment increases that a corridor program would generate over normal expected growth.

## Enhancement Adjustment

The impact of a four lane corridor system will vary from community to community due to differences in the natural, man-made, and labor resources available. Although conservative, the principal cities and counties within the District could expect to range close to the Forrest City/St. Francis County - Searcy/White County composite annual growth rate of 2.36 percent as a result of highway improvements.

Based on historical trends and projections obtained from Research and Public Services, University of Arkansas at Little Rock, both employment enhancement and state tax revenue enhancement were determined for the Southwest Arkansas Planning and Development District's area. The research assumed that a corridor system would pass through the county or would be accessible to the county. Built into the adjusted projections was the assumption the road construction would involve a number of years; and the initial impact would be realized during the decade from 1990 to 2000.

Total state revenues were derived from a factor obtained from a model used by Dr. Phillip Taylor, Director of the Bureau of Business and Economic Research, College of Business Administration, University of Arkansas at Fayetteville. This factor was applied to the difference between the historic trend

and the adjusted projection of Total Personal Income.

Using 1995 as the base year, the District's total state tax revenue enhancement for the Year 2000 would be $65,423,838; Year 2005 would be $163,985,274; and Year 2010 would be $254,705,588. This is based on the area's projected increase in personal income. The area's personal income enhancement from such an intrastate system was found to be as follows: Year 2000, $968 million; Year 2005, $2.426 billion; and Year 2010, $3.768 billion.

The population enhancement for Southwest Arkansas with a corridor system was found to be 34,014 in Year 2000; 73,288 in Year 2005; and 101,487 in Year 2010. In order to realize the total employment enhancement from a corridor system, a multiplier of .41 was used (based on 1985 state employment statistics). The total employment enhancement was found to be 13,916 in 2000; 29,983 in 2005; and 41,519 in 2010.

Although our study was conducted conservatively, the state tax revenue enhancements and employment enhancements indicated significant impacts for Southwest Arkansas. For example, if the total employment enhancement was divided evenly among the twelve counties in the area, a minimum of 1,000 jobs per county would be created during the initial impact period. In summary, job creation and the subsequent increases in personal income and state tax revenues would provide opportunities for economic growth with an intrastate system in place.

## EXISTING ROUTE PROPOSALS

In January of 1988, the Arkansas State Highway and Transportation Department released a preliminary version of an economic development corridor improvements program for the State of Arkansas. The program outlines a proposal that will connect all cities of 10,000 population or more with a four-lane facility; link all cities projected to be over 5,000 population by 2010 to the four lane system; and link all tourist generators and major commodity flow routes to the four lane arterial system.

The program is designed to improve the State Highway System's major highway network, and represents the need for road improvements as viewed by the industrial developers and other groups in the state. The program proposes to widen certain routes to four lanes, and to improve other routes by adding climbing or passing lanes.

The following map illustrates the proposed routes identified by the Arkansas State Highway and Transportation Department for the respective area within Southwest Arkansas.

# ECONOMIC DEVELOPMENT CORRIDOR IMPROVEMENTS

**$1,977,000,000**

# ECONOMIC DEVELOPMENT CORRIDOR IMPROVEMENTS

## FACTS

- The program is designed to improve the State Highway System's major highway network.
- The program assumes that Arkansas will continue receiving Federal aid at the current rate and categories.
- All cities of 10,000+ population will be connected with a four-lane facility.
- All cities projected to be over 5,000 population within 20 years will be linked to the four-lane arterial system.
- All major commodity flow corridors will be linked to the four-lane arterial system.
- Enhanced access to major tourist generators will be provided.
- The present Ten-Year Rural Highway Construction Projects will be completed as planned.
- 72% of statewide vehicle miles traveled will be on the four-lane arterial system.
- Each $1.00 spent on construction generates approximately $2.5 in increased economic stimulations.
- 89% of the truck vehicle miles traveled will use the four-lane arterial system.
- 95.5% of total statewide population will be served.
- Over 125,000 new jobs will be created due to construction activity.

### COMMUNITIES WITH MANUFACTURING PLANTS BY HIGHWAY SERVICE (1986)

| | Number of Communities | Total Mfg. Employment | Avg. Mfg. Employment | Number of Plants | Average Number of Plants |
|---|---|---|---|---|---|
| With 4-lane | 59 | 89,542 | 1,518 | 1,048 | 17.8* |
| Without 4-lane | 232 | 134,393 | 579 | 1,497 | 6.5 |
| Statewide | 291 | 223,935 | 770 | 2,545 | 8.7 |

*Communities on 4-lane highways have approximately three times as many plants as communities on 2-lane highways.

## ACCESSIBILITY TO MARKETS

Southwest Arkansas is in a unique position within the state in its accessibility to many market areas. The region lies within the central market areas and to the west of the eastern market areas of the United States. Southwest Arkansas is located north and northeast of Dallas, Houston, Gulfport, Shreveport and New Orleans; southeast of Oklahoma City and Tulsa; west of Nashville, Knoxville, Atlanta, and Birmingham, and south and southwest of Indianapolis, Louisville, Springfield and Kansas City. These major market areas represent approximately 30 percent of the nation's population.

DISTANCE TO MAJOR MARKETS

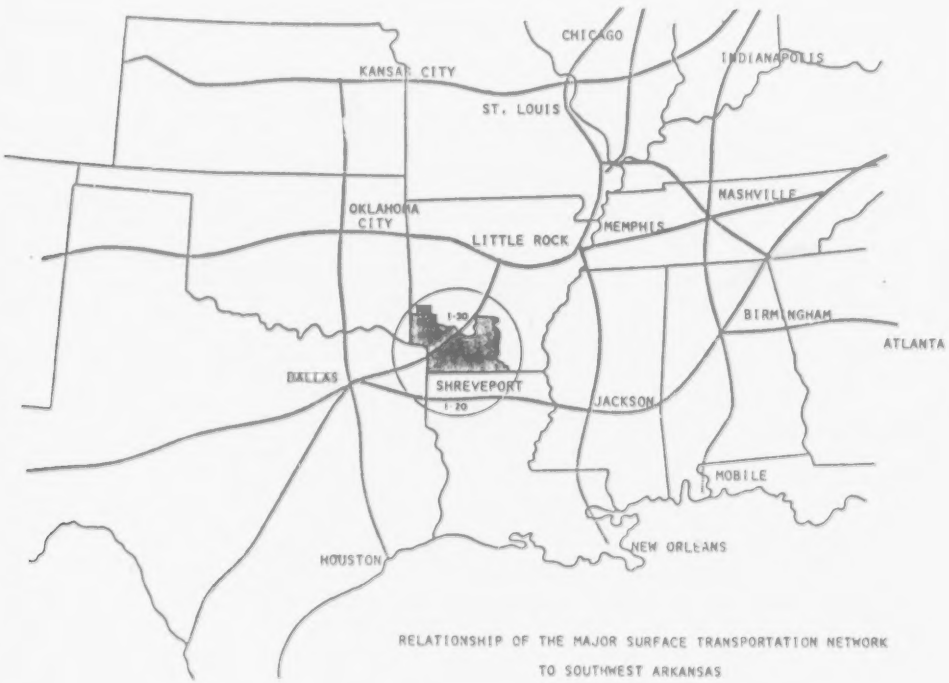
Within Southwest Arkansas Planning and Development District, Interstate 30 runs through Miller, Hempstead, and Nevada Counties. The existing interstate is approximately an hour's driving time in relation to most of the region, with the exception of Union County. On the other hand, the southern border of the state is within an hour's driving time of Interstate 20, which runs through Louisiana. Interstate 20 provides access to an east/west flow. Interstate 30 offers split access, flowing predominately west/southwest on the bottom leg and north/northeast on the top leg. Through its unique location and accessibility to two different interstate systems, the Southwest Arkansas Planning and Development District is within ten hour's driving time of the following major market areas: Dallas, Texas; Houston, Texas; Shreveport, Louisiana; Oklahoma City, Oklahoma; New Orleans, Louisiana; St. Louis, Illinois; Mobile, Alabama; and Tulsa, Oklahoma.

For those growth centers located on or near Interstate 30, regional accessibility via the current highway network is not much of an issue. But to those communities located off the interstate system, distance and the quality of connecting routes accessing the interstate system present a real disadvantage in attracting manufacturing and service industries, and in transporting goods and services to major market areas on a timely basis. Overall, accessibility north to south through Southwest Arkansas to the interstate systems is considered fair to poor, and has in the past been a factor unfavorable to new

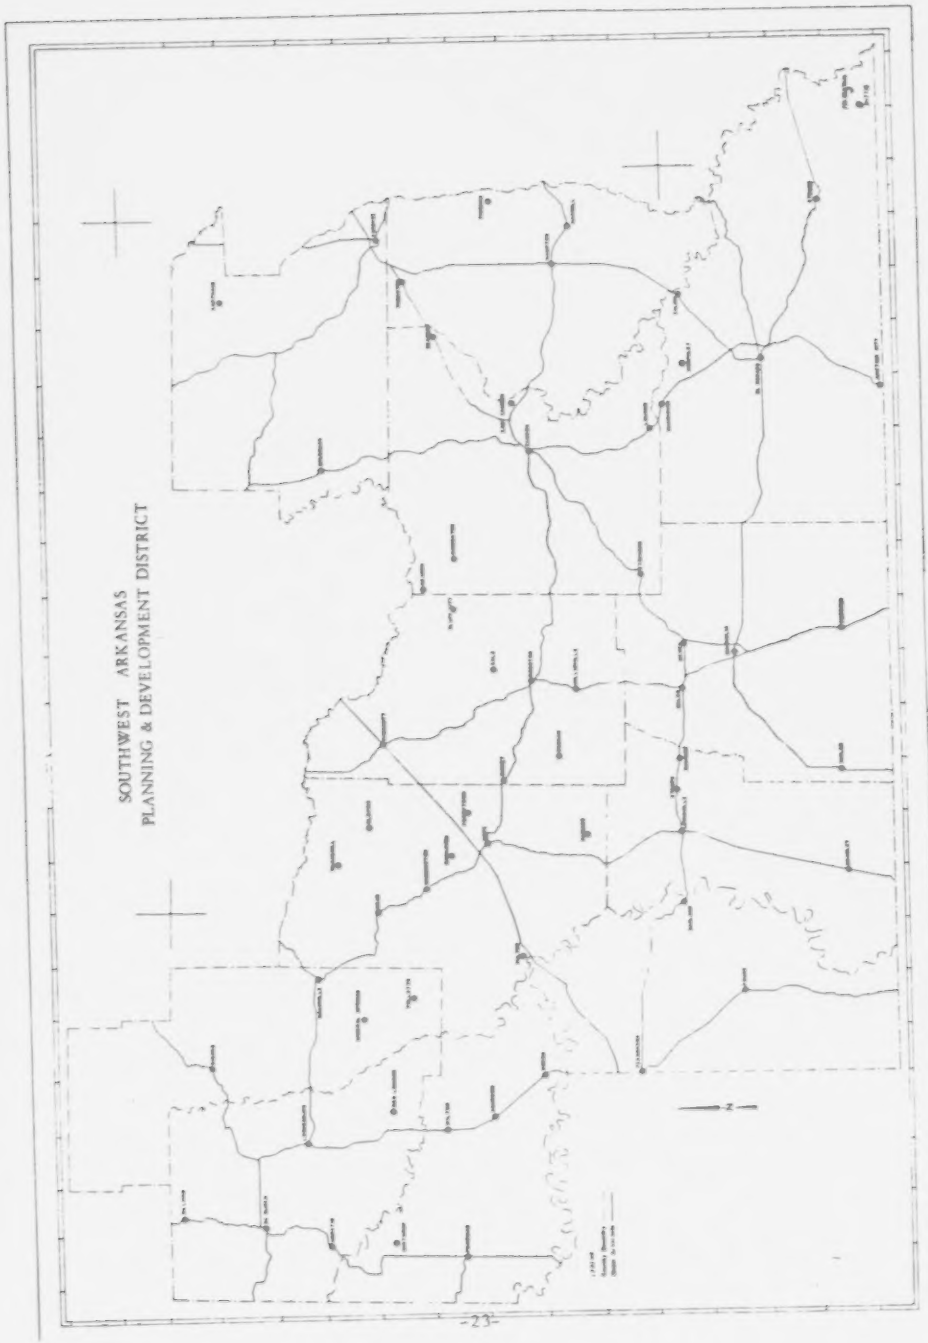
45-155 O—91——78

and satellite plants locating in the southwest portion of the state.

Any intrastate system flowing through Southwest Arkansas must be responsive to the needs of those industries using the highways in this area. The following map illustrates that Interstate 20 and Interstate 30 anchor any transportation system proposed for the area. As the regional map indicates, Interstates 20 and 30 give the area access to the major markets.



RELATIONSHIP OF THE MAJOR SURFACE TRANSPORTATION NETWORK TO SOUTHWEST ARKANSAS



SOUTHWEST ARKANSAS
PLANNING & DEVELOPMENT DISTRICT

## SURVEY METHODOLOGY AND RESULTS
## INTEREST INDICATOR FOR THE PROPOSED
## SOUTHWEST ARKANSAS ECONOMIC CORRIDOR SYSTEM

The interest survey for the proposed Southwest Arkansas Economic Corridor System was designed to measure: 1) the current usage of the present highway system in Arkansas by industries in our region; 2) the growth potential of these industries assuming a convenient access via a four lane highway to a major interstate system was in place; and 3) the major transportation limitations affecting the industries overall growth potential. The survey field included the industries within Southwest Arkansas, comprising a twelve county area, and listed in the 1987 Directory of Arkansas Manufacturers.

The survey was conducted as a team effort between Arkansas Louisiana Gas Company and the Southwest Arkansas Planning Development District, Inc. (SWAPDD). The survey instrument was prepared by the SWAPDD and developed based on the three main points addressed above. Personal interviews were conducted throughout the District in cooperation with Arkla Gas. Once completed, the surveys were reviewed and computed by the SWAPDD. A copy of the survey instrument is attached to this report on pages 30 and 31. It should be noted that the results reported are restricted to the actual number or percentage of the industries responding by county, and not based on the entire sample area.

In order to measure the current usage of the present highway system by industry, we examined the different modes of transportation used to receive raw materials and supplies, as well as comparing points of origin. Questions 4-6 from the survey form address this issue. The majority of those surveyed reported that the raw materials and supplies received are transported via incoming trucks. Of the 96 industries surveyed, it was found that 97% received raw materials and supplies by truck distribution, while only 3% received incoming materials and supplies by rail. The average number of incoming trucks reported per week was 65. The survey indicates that 55% of the materials and supplies are received from within the State of Arkansas, while 67% are received from out of state sources. The following compares the results of the survey based on the shipment of raw materials and supplies received into Southwest Arkansas from regional areas located throughout the State and extending nationwide:

TABLE 1

SHIPMENT OF RAW MATERIALS AND SUPPLIES

INTO SOUTHWEST ARKANSAS

| Region | In State | Out of State |
|---|---|---|
| Northeast | 6% | 15% |
| Southeast | 13% | 30% |
| Central | 3% | 24% |
| Southwest | 35% | 21% |
| Northwest | 3% | 1% |
| Statewide: | 10% | |
| Nationwide: | | 6% |

Another factor used in the survey to determine the usage of the highways was the outgoing shipment of products. The survey indicates that 51% of the industries ship in-state while 78% of the industries ship their major product lines out-of-state. The following compares, on a percentage basis, the shipment of major products from Southwest Arkansas to other areas within the State versus shipment to regional market areas (out-of-state).

TABLE 2

SHIPMENT OF MAJOR PRODUCTS

FROM SOUTHWEST ARKANSAS

| Region | In State | Out of State |
|---|---|---|
| Northeast | 2% | 6% |
| Southeast | 13% | 21% |
| Central | 0% | 23% |
| Southwest | 22% | 26% |
| Northwest | 4% | 0% |
| Statewide: | 25% | |
| Nationwide: | | 28% |

The predominant market areas include the Southwest, Southeast, and Central sections/regions of the United States comprising some ten states including Texas, Oklahoma, Louisiana, Tennessee, and California. More importantly, 28% of the total products shipped are distributed nationwide.

In order to determine the projected operations or potential growth of an industry, based on the assumption that the industry

had access to a major interstate system, question 8 was examined. In support of this information, questions 7, 9, and 10 were also reviewed.

Responses to question 8 indicated 52% anticipated the potential for accelerated growth, both capital investments and increased employment levels, if access via a four lane highway system to a major interstate was made available. It was also found that this growth would be enhanced over a 20 year time period. The majority of the responses indicated that their potential to double their present operations was restricted due to the lack of a 4 lane access to a major interstate system.

It was also found that 54% perceived that there was a potential for growth of satellite support industries to locate in their immediate areas. Currently, cost is a major factor affecting many of the industry's ability to compete with comparable manufacturers. In addition, it was found that the respondents noted that improved access to major highways was indeed a predominant factor to locating satellite industries and competing on a national level with other market areas. Types of such support or spin-off industries likely to develop include: fabrication and machinery businesses, auto/truck assembly and component parts plants, pulpwood industries, defense industries, custom rubber mixing, steel supply mills, truck/freight lines, raw material suppliers/resource industries, feed mills, sawmills, high tech industries, furniture or cabinetry

manufacturing, component parts for lighting, contract maintenance and inspection services.

In examining the potential for industrial growth and the major transportation limitations affecting industries, questions 12 and 13 were established and reviewed. Responses indicated that 36% of the industries utilized Interstate 30; 6% responded to Interstate 20; and 50% cited both interstate systems as of equal importance. Responses to question 13 were categorized into two areas of major concern with regard to the current transportation system. These areas of major importance were addressed as follows:

1) Inadequate road system - poor deteriorated road conditions or narrow 2-lane highways. The lack of 4-lane passing segments along Highway 82 serving as an East/West route and on the major North/South routes interconnecting with Interstate 30 and Interstate 20.

2) Limited highway accessibility to the interstate system (primarily North/South and East/West routes). Due to the limited access via highways to a number of the industries within Southwest Arkansas, these industries are unable to compete with other comparable industries and businesses who have adequate access to the regional interstate network. The surveys indicated that many of the industries are economically disadvantaged because of a lack of accessibility to the interstate system due to the high shipping and transport costs.

Other areas of concern include: inadequate accessibility to commercial air line service and high rail delivery costs. Only 3% or less indicated no transportation limitations affecting their overall growth potential.

INTEREST INDICATOR FOR THE PROPOSED
SOUTHWEST ARKANSAS ECONOMIC CORRIDOR SYSTEM

1. Name and address of industry: _____
_____ County _____
_____

Major Product _____

Labor Force

2. What is your average annual level of employment for calendar year 1987? _____

3. Provide the following information concerning resident location of your work force:

#_____or_____% residing within home county
#_____or_____% residing in adjacent instate counties
#_____or_____% traveling 80 mi/day or more round trip
#_____or_____% from out of state

Transportation

4. How do you receive raw material or component parts?

Truck - Yes _____ (Give average incoming # of trucks/week)
Rail - Yes _____ (Give average volume or # of carloads of raw goods received/wk)
_____ Other

5. Are most of your raw materials and supplies received from:

_____ In State:
_____ Northwest Section
_____ Northeast Section
_____ Southwest Section
_____ Southeast Section
_____ Statewide

_____ Out of State: List state or region of the country. _____

6. Do you ship most of your product:

_____ In State:
_____ Northwest Section
_____ Northeast Section
_____ Southwest Section
_____ Southeast Section
_____ Statewide

_____ Out of State: List state or region of the country. _____

Projected Operations

7. Do you currently anticipate expanding your operations by 1995? Yes_____ No_____

   If "Yes," what is the range of your anticipated expansion?

   Proposed capital investments: $_____ to $_____
   Increases in employment levels: _____ to _____ people.

8. If you had convenient access via a 4 lane highway to the major interstate system, do you feel that your industry would have an accelerated growth potential above and beyond that proposed above? Yes _____ No _____

9. If "Yes," and assumming a 4 lane route was available today, how would you revise your projected 1995 expansion figures?

   Capital Investment_____
   Increased Employment _____

10. Do you feel that there is a potential for growth of satellite support industry to locate in your immediate area?

    Yes _____ No _____

    If "Yes," do you feel improved access to major highways is a conditional factor to this? Yes _____ No _____

11. Generally what type of satellite support or spin-off industry would likely develop?

    _____
    _____
    _____

12. Which interstate access by a 4 lane highway is more important to your future industrial growth?

    _____ I-30 _____ I-20 or _____ both equally important

13. What is the major transportation limitation affecting the growth potential of your industry?

    _____
    _____
    _____

# DETERMINATION OF ENHANCEMENT FACTOR ATTRIBUTABLE TO THE DEVELOPMENT OF FOUR LANE HIGHWAY CORRIDORS

## METHODOLOGY

The process used to determine the impact a four lane highway corridor would have on the social economic environment it passed through was to examine changes that occurred in two rural areas in Arkansas, that within the last twenty-five years, saw four lane highway development take place. Statistics were compiled for the areas, if data was available, from at least one decade or more prior to the completion of the improvement to the present time for population, per capita income, and employment.

A regression analysis was run on the data elements for those time periods prior to completion of the highway to determine the growth rate for future periods that would likely result as a continuation of past growth activity. This trend was projected forward to the next reporting period after the improvement was completed and a base line value of growth established.

Rates of annual growth and percentages of change were then calculated for that period during which the improvement was put into service for the actual historic change that took place, and for the corresponding change that the extension of the regression trend produced. Theoretically, the difference in the

composite rates of change and differences in composite absolute change between the two trends, could be considered as reflecting the enhancement attributable to the completion of a four lane highway corridor through the area. However, it is important to remember that many variables influence the way in which a given area grows, and depending on the circumstances affecting change, growth trends could be noticeably altered irrespective of the introduction of significant surface transportation improvements. For the analysis, this means that the composited identified rates for the various data elements examined may be adjusted downward or dropped entirely, to take into account the independent affects of undetermined variables on the growth of the area.

The enhancement factor arrived at through this procedure will then be applied to population and income trends, based on the determined relative impact any corridor is considered to have on the area it passes through, or the communities it serves.

After the enhanced income figures are arrived at, the relationship of personal income to state revenue expressed as a multiplier, developed by the Bureau of Business and Economic Research in the College of Business Administration at the University of Arkansas in Fayetteville, can then be applied to the projection of personal income, to determine the additional state revenue that enhanced growth of the level suggested would produce.

The output of this process will be trend projections and trend projection enhancements for population and personal and or per capita income; and additional total state revenues that would be produced if four lane corridor development in the State of Arkansas, has the impact on the state's cities and counties as predicted by the application of the enhancement factor.

The two localities selected for examination are White County and its principal city, Searcy, located on U. S. Highways 67/167; and St. Francis County and its principal city, Forrest City, located on Interstate Highway 40. Data studied for both areas included income and employment at the county level; and population at the community level.

The following section describes the characteristics and relationship between the historic movement and trends of the three data sets used in the enhancement factor determination.

COMPARATIVE ANALYSIS

White County - Searcy

General Description of Locality

White County is located in the west central part of the eastern half of Arkansas. The western two-thirds of the county is situated along the edge of the Ozark Foothills. The eastern one-third is bottomland along the White River.

Agriculture is fairly well diversified, including row crop farming, livestock, and poultry production.

Searcy, the principal city, is located in the central part of the county, about 45 miles northeast of downtown Little Rock. The 1985 estimated population was 14,733 persons. Searcy is the home of Harding University, one of the state's finest private institutions of higher learning. In addition to Harding University, a branch campus of Arkansas State University at Jonesboro is located at Beebe, fourteen miles southwest of Searcy on U.S. Highway 67.

The economic and population base of White County and Searcy has shown good performance over the last thirty-five years, even during agriculture's metamorphic period of the 1950's and 1960's, which severely impacted the more delta-oriented counties along the Mississippi River.

Trend Characteristics

A. Population: Searcy

Graph plots of the historic trends and projection extension indicate that there was a significant deviation from the historic trend during the decade in which U.S. Highway 67 was four laned through Searcy. The percent change in historic data over the 1970/1980 period was nearly 52 percent, compared to a 16 percent increase over the same period for the extension of 1950/1970 based trend projection. The difference between the two was about 36 percent.

In terms of annual growth rates, this increase amounted to 4.28 percent for the historic trend, and 1.52 for the 1950/1970 based projection extension over the same period; for a difference in the annual growth rates of 2.75 percent.

B. Employment: White County

Employment trends showed sharper movement upward with about a 92 percent change for historic data between 1970 and 1980, and more than 26 percent for the 1950/1970 trend projection extension. This amounted to an overall annual growth rate difference of about 4.33 percent between the historic, with a 6.71 percent annual rate of growth, and the trend

projection rate of 2.38 percent annually.

C. Per Capita Income: White County

Per capita income figures jumped markedly over the same period, showing more than a 160 percent change over the 1970 to 1980 decade. Trend change based on the 1950/1970 data amounted to only 31 percent between 1970 and 1980. The annual rate difference (historic over trend) was 7.32 percent. The graph of the per capita income trend using 1950/1970 base data, and the trend based on 1950/1985 data bears a striking similarity to the graph of population trend projections using the 1950/1970 data base, and the trend derived form 1950/1985 data base.

The similarity of the historic data and trend projections for population and per capita income, suggest that in the case of White County there is a strong relationship between what happens to the population in Searcy, and the movement of per capita income levels of the county. If this is indeed true, then the same enhancement factor used to determine population growth can also be used to predict future levels of per capita income.

The table and graphs that follow depict the historic trends and projections described above.

## St. Francis County - Forrest City

## General Description of Locality

St. Francis County is located in the east central region of the eastern half of Arkansas. The general topography is flat with nearly three-quarters of the county consisting of bottomlands. A high ridge traverses the county from north to south splitting the county roughly in half. The St. Francis River follows the ridge on the east.

Row crop farming is the principal agricultural activity of the bottomland regions of the county. Some livestock production takes place in the Ridge along with the raising of one of the county's best known local products - peaches.

Forrest City is the principal city in St. Francis County located about 46 miles west of downtown Memphis, Tennessee, and 90 miles to the east of Little Rock. The 1980 population of Forrest City was 13,803 persons. Forrest City is the home of East Arkansas Community College and a new 15 million dollar medical facility operated by Baptist Medical Group of Memphis.

The economic and population base of St. Francis County and Forrest City has been in a state of flux for some time. Population trends of the county in general, and the rural portion in particular, have shown steady declines since 1950, and only during the 1970 to 1980 decade has moderation of this

trend been evident. The overall county population showed a slight increase from 1970 to 1980, primarily from continued gains taking place in Forrest City and the rural settlements. These changes in the rural population are typical of delta region trends since the early 1950's, fueled by the reorganization of delta agricultural practices.

Forrest City sits in an enviable position within an easy commute of Memphis on Interstate Highway 40, and while the community saw steady growth through the early 1970's, internal struggles within the city created a climate that is potentially on shaky ground. Symptomatic of this is the current high unemployment rate and declining industrial base.

Trend Characteristics

A. Population: Forrest City

Graph plots of the historic trends and projection extensions indicate that there was a noticeable deviation from the historic trend during the decade in which Interstate Highway 40 was completed through Forrest City. The percent change in historic data over the 1950/1960 period was nearly 39 percent, compared to a 19 percent increase over the same period for the extension of 1930/1950 based trend projection. The difference between the two was slightly less than 19 percent.

In terms of annual growth rates, this increase amounted to 3.32 percent for the historic trend, and 1.82 for the 1930/1950 based projection extension over the same period; for a difference in the annual growth rates of 1.50 percent.

A look at the 1950 to 1970 change in the historic population indicates more than a 64 percent increase with the 1930/1950 trend projection over the same period showing a change of 39.5 percent. Annual growth rates for these time periods are 2.52 and 1.68 percent respectively. The difference is slightly less than one percent (.84 percent).

B. Employment: St. Francis County

Employment trends were not calculated or evaluated due to the lack of data continuity for the historic period 1940 to 1980.

C. Per Capita Income: St. Francis County

Unlike the trends for White County, changes in per capita income historic figures for St. Francis County were substantially more moderate in their movement upward, and showed little relationship to population movements recorded for Forrest City during the decade of highway improvements. The plot of the regression trend again reflects a flatter

movement upward more closely resembling the trend projection of the 1930/1950 base data, rather than paralleling the changes in population observed between 1950 and 1960.

The differences between the historic figures and trend using a 1950/1970 data base were negligible, fluctuating a half percentage point either way. Annual rates of growth for the two observations were likewise equal, with a rate difference of zero. Substantial movement in per capita income did not occur until the 1970/1980 decade, showing a 144 percent increase in the 1980 figure over that recorded in 1970.

This movement is similar to that displayed for White County, although the increase was not as great. In fact, the per capita income of White County was actually lower than St. Francis County in 1950, catching St. Francis County in 1960, and surpassing the county by more than $3,000 in 1985.

It is appropriate to repeat here that the White County rural area did not experience the turmoil of the mid 1950's through the 1960's that the delta counties to the east had to survive. Consequently, one could expect a better correlation between socio-economic factors overall in White County. To a great extent this is born out by observation of more current trends in the movement of per capita income in St. Francis County. Now that a level of stability in the

rural area has occurred, trends in per capita income based on 1960/1980 data more closely approximate the population trends projected from a 1950/1980 data base. The table and graphs that follow depict the historic trends and projections described above.

## Analysis Discussion

From the description of the two areas, it is obvious that Forrest City and Searcy have considerably more in common than the counties of which they are a part. Both cities are roughly the same population, are located less than fifty miles from a major metropolitan area; and each possesses, or at least at one time possessed, comparable industrial bases.

Growth trends for the two communities calculated on a 1950/1980 data base are quite similar, with the slope of Forrest City's trend slightly flatter. If 1940 data is introduced into the Forrest City regression, a more noticeable convergence is evident. The primary reason for this is that Searcy experienced a greater percentage of change during the period of four lane highway completion than did Forrest City, while historic data prior to those decades displayed similar growth patterns for both communities. Essentially, Searcy's pattern of growth is a mirror image of Forrest City's, reflected two decades into the future.

The difference in growth evident between the two cities during that period when each of the corridors was completed, could be the result of many factors not fully discernible in the time allotted for this study. But certainly some of the more obvious that would have some bearing on the situation would include the time period in which each improvement was completed; the

influences of institutions of higher education present in Searcy and White County that did not exist in the St. Francis County area; and the overall stability of the rural economic structure in White County compared to that present in St. Francis County when highway improvements were completed.

Applying this reasoning to the establishment of a reasonable enhancement factor that can be used to express the impact corridor development would have on a variety of growth profiles of areas into which four lane highway development is introduced, is probably open to as many interpretations as there are persons holding opinions on the subject. In the absence of additional case studies that may prove otherwise, it seems appropriate to view with some degree of skepticism the growth trend differences expressed earlier in this report, particularly in Searcy's case, as being entirely motivated by highway corridor construction, considering the other strengths this locality enjoys apart from four lane roads. The rate of growth difference expressed for Forrest City would probably come closer to approximating the real impact a four lane highway might produce on a community, since some important elements Searcy possesses were not present in the Forrest City area at the time Interstate Highway 40 was completed.

In light of this, the three agencies cooperating in the development of the methodology for the impact report, decided that the prudent course of action would be to develop a

reasonable mid-point factor that moderated the influence of independent variables, while at the same time factoring in the future appearance of stronger community facility structures, as might be expected to take place in any areas over time. The factor arrived at using this process represents the composite weighted average rate of growth of the two cities for population change, since it appears to be the more conservative of other values change examined.

This factor will then be used to calculate the population enhancement that might reasonably be expected from four lane highway corridor development through any given area, with adjustments as appropriate to reflect varying degrees of impact based on the proximity of the corridor to beneficiary economic development centers.

It has also been pointed out that there was a strong relationship between the trends in per capita income for White County and population trends in Searcy; and when a current data base was used to establish trends in St. Francis County, a similar relationship was observed between Forrest City's population and county per capita income. This suggests that the same enhancement factor derived from population change can also be used effectively to predict future per capita income values, and from that total personal income. This in turn will lead to estimates of additional state revenue that might be generated from the completion of a statewide system of four lane highway

corridors, provided growth in income occurs as predicted.

In the Methodology Section, it was mentioned that employment would be one of the characteristics studied and the results used in the development of an enhancement factor. However, during the examination of the two localities and their principal cities, it was found that employment data for St. Francis County lacked continuity over the study period to effectively develop a trend that could be compared either to the result obtained for White County, or to the population trends in Forrest City. Consequently, no attempt was made to factor employment into the calculations for determining the weighted composite average rate of growth.

Omitting employment from the analysis was not considered a serious matter for three reasons. These are:

1. The major thrust of this report is identifying the enhancement to state revenues that corridor development might produce.

2. There was a strong similarity between trends in per capita income from which an approximation of total personal income can be derived; and trends in population movement.

3. The University of Arkansas model predicting total state revenue from personal income produced a 98 percent

correlation between changes in personal income and changes in state revenues.

Employment comparisons are therefore not needed in order to derive either population or probable income enhancements likely to occur from corridor development. It is however important to the portrayal of total impact to at least indicate a reasonable expectation of employment gains that may result from improved highway accessibility.

Like income, there is a relationship between population and employment increases. If in fact there is an enhancement in population and personal income, it stands to reason there would also be a corresponding positive impact in the employment outlook in those areas benefiting from four lane corridor development.

To show this, the ratio of current total state covered employment to total state population was calculated for the year 1985. This ratio, or multiplier, has been applied to the population enhancement attributed to corridor development from the established base year or years to which enhanced growth rates were applied, through the end of the projection period; year 2010.

## ENHANCEMENT FACTOR CALCULATION AND APPLICATION

### Enhancement Factor Calculation

The table included in this report shows the results of compositing the annual growth rates and absolute change, or percent change for a ten year period. The calculations produced a composite annual growth rate of 2.36 percent per year for the decade in which four lane highway improvements were completed. The composited absolute change, or percent change derived from the calculations amounted to 30.42 percent over a ten year period. This figure was higher than the computation of future value applying the composite rate of annual growth over the same ten year period, which produced 26.27 percent increase overall.

The method used to composite the two indices, was to multiply the difference between historic change and the extension of the trend over the same period developed from base data preceding the improvement, by the annual growth rate difference in one table, and the percent change in the other table. The weighted values for Searcy and Forrest City were then summed and that figure divided by the sum of the difference between the historic and trend extension for the two communities. This produced a weighted composite annual growth rate of 2.36 percent, and a ten year absolute change value of 30.42 percent.

To determine which factor represented the lesser value over a ten year period, the composite annual rate factor was computed

over a ten year term, producing a 26.27 percent change over the term. Since the annual growth rate figure was the smaller of the two, the composite annual growth rate was selected as an enhancement factor to be applied to population and income, in total or adjusted, depending on benefit, to determine the impact corridor development would have on any given area under analysis.

Application of Enhancement Factor

In both the case of Forrest City and Searcy, it appeared that the maximum impact took place during the ten year period in which the facility was completed or within ten years after completion. Absolute increases after the initial ten year period moderated somewhat, more closely paralleling the trend derived from historic data in the decades prior to completion of the highway. However, it should be noted that these trends represent apparent impacts that stand-alone four lane highway facilities had on two communities not served by other four lane facilities.

The same two communities located on and part of a network of four lane corridors, might have experienced a totally different set of impacts to those identified in this discussion. Without knowing up front how such a program in Arkansas may be implemented, the realistic approach to identifying impacts is to apply the findings of the comparative analysis of the

Searcy/Forrest City experience. That experience indicated that in both communities, the growth rate jumped dramatically over the historic growth trend during the first decade after completion, and tapered off to about two-thirds of the initial growth rate during the next decade following the decade during which the jump occurred.

The enhancement factor was applied to the historic trend of each county, in total or with adjustment appropriate to the benefit produced for the first ten year period; and a one-half to two-thirds of the factor, with or without adjustment, to predict population and income levels beyond the first decade of estimated impact. The composite weighted average annual growth rate may be adjusted as appropriate to the situation in each county, based on road segments presently under construction; likely timing of new corridor completion; the market orientation and relative importance of the corridor; and other factors existing within various sections of the study area that are now, or will be exerting a strong influence in shaping development opportunities in future years.

## LITERATURE REVIEW

The literature review undertaken for this analysis revealed that highway impact studies are generally historical. They include a before, during, and after analysis of various factors - centering on changes in land values.

Since this study was an effort to predict highway project impacts on highways to be built in the future, with emphasis on changes in population, employment, income, and state revenues, only parts of these comparative studies were useful.

What is clearly shown in the studies is that highway impacts vary greatly, depending upon a variety of circumstances, including timing, staging, location, the existing economic base, and a good many other variables. In fact, impacts can range from negative to extremely positive - with even both extremes occurring at different locations on the same highway.

Even if the types of analysis completed in other studies were desirable in this case, the time and data required were not available. To a large extent, moreover, the changes in land uses values and similar variables require specific highway location knowledge that is not yet defined for the Arkansas Corridor System.

Among the studies cited (see sources) there were several which

included the population changes that occurred following the highway projects studied. In these cases, the changes were generally somewhat higher, relative to a given control area, than the composite average used for this analysis - although these studies were generally for specific roads in a limited area, or segments of the interstate system. Thus, given the comparable information that is available, the results of this study might be considered conservatively in the scope of the actual impacts likely to be experienced in Arkansas.

The following is a list of the major highlights of the other economic impact studies reviewed on four lane highway construction and/or improvements.

(1) Extreme land value increases occur almost immediately after a highway improvement/construction project has been announced.

(2) Land values increase more between the before construction and during construction period, than in the during and after construction periods.

(3) Abutting properties receive a greater influence than non-abutting properties in both land value and land use.

(4) Land values increase with road improvements, for example, from improvements in surfaces, or an increase in the number of lanes.

(5) User analysis proves that staged construction costs more in vehicle user costs than the benefits gained from delaying

highway construction expenditures.

(6) Commercial development is affected by the amount of time local people must utilize a service road during highway staged construction.

(7) Positive economic impacts from highway improvements tend to be at highway intersections.
